philological approach and the application of a historically aware interpretation of classical sources. His tenure at the University of Bourges was of crucial importance for the establishment of a new legal tradition, an alternative to the *mos italicus* and known as the *mos gallicus*. This reformed conception of law became dominant in France – and secondarily in Germany – while in Italy the *mos italicus* remained predominant. In the Italian peninsula, the legal tradition was, in fact, more “concerned to preserve the spirit of Classical forms rather than the letter of Classical texts” (Kelley 1979, 784). Recent scholarship, though, has argued that this opposition of approaches should not be seen as rigid since the two conceptions of law often coexisted in the university environment (Birocchi 2012). Such was the case, for instance, in the University of Pavia, where distinguished and lesser-known law professors between the sixteenth and the seventeenth century showed a general appreciation of humanist ideas and an inclination to follow the renowned exponents of the *mos gallicus* (di Renzo Villata 2015). Furthermore, a certain underlying tension in relation to this new reformed vision of law is testified to by the explicit request made by students of the University of Bologna: in a memorandum drafted in 1583 and sent to Ulysse Aldrovandi, they asked to be taught the *Pandects*, part of the *Corpus juris civilis*, in accordance with the French teaching style (Lines 2012, 19–20).

The new approach to the sources and their form helps to explain the third crucial development brought about by humanists: the reassessment of the canon of authorities and (on a more practical note) the replacement of texts and textbooks employed in university courses. Perhaps the insertion of Platonic theories into the canon of university courses was the most influential change. This process was neither smooth nor rapid nor long-lasting in a theoretical framework dominated by Aristotle. It was possible only after fifteenth-century humanists provided fresh Latin translations of Plato’s works, making it easier for scholars to lecture on them. Following pioneering attempts to offer a course on Plato’s works in fifteenth-century Ferrara and sixteenth-century Pavia, the first unpaid lectureship on Plato in the

Italian peninsula was established in Pisa in 1576, and the first ordinary professorship of Platonic philosophy was created in Ferrara in 1577 (Grendler 2002, 297–304). The Ferrara chair was first held by the Platonic philosopher Francesco Patrizi of Cherso (1529–1597), who proposed Platonism as a philosophical alternative to Aristotelianism. Despite the increased interest in Platonic works, Platonism as an academic subject never succeeded in firmly establishing itself within the university curriculum, and the number of Platonic lectureships decreased in the closing decades of the sixteenth century. In addition to Plato himself, the humanist determination to unveil new sources also brought in other philosophers belonging to the Platonic tradition.

In general, the pragmatic humanist approach also had consequences for everyday university life. For instance, it encouraged revision of the texts or materials used for teaching. There was often debate as to which books to use in class. Humanists teaching grammar in sixteenth-century German universities disapproved, for instance, of Alexander of Villedieu’s *Doctrinale*. They emphasized its lack of elegance and opted instead for the works of humanist grammarians. This apparently minor quarrel over a textbook actually implied a more profound discussion of the subject’s aims: on the one hand, traditionalists prepared students to engage in dialectical reasoning by acquiring a superficial and instrumental knowledge of Latin; humanists, on the other hand, wanted students to be able to comprehend and write Latin texts properly. The humanists won this battle, and the *Doctrinale* gradually fell into disuse in universities (Heath 1971, 16–17, 26–28; Nauert 1990, 804–805). Again in German universities, the efforts of humanists were instrumental in introducing Cicero and Quintilian into the teaching program of rhetoric (Nauert 1990, 806).

The assumption that humanism was the only factor encouraging innovation within the European university should be rejected for two reasons. First of all, the spread of the humanist methodology did not exclude scholasticism from universities. It is now clear that the resulting dichotomy cannot be drawn in rigid terms. The diffusion of humanist techniques throughout the

curriculum did not replace the dialectic method of scholasticism in university teaching. It was, then, a merger of these two apparently opposing methods that fostered development in many disciplines. Furthermore, modern scholars have arrived at a more unprejudiced and balanced interpretation of scholasticism. Although they have not denied a certain degree of backwardness, they have also recognized that this approach to education was creative and responsible for some important cultural advancements (Lines 2006, 344–345). For instance, the philosophy professor Pietro Pomponazzi of Mantua (1462–1525), who taught in Padua, Ferrara, and Bologna, played a key role in the development of the debate on the immortality of the soul, asserting the independence of the philosophical perspective from theology. In his major work, *Treatise on the immortality of the soul* (1516), he stated that while the intellective soul is mortal in philosophical, that is, Aristotelian, terms, it is immortal according to faith (Grendler 2002, 290–292).

To conclude, neither scholasticism nor humanism alone proved to be the key factor in fostering innovation in universities. On the contrary, it was more likely the evolution of this relationship that was the impetus behind the new developments mentioned above as well as many others. The Renaissance university, then, despite its still quasi-medieval structure, provided the most suitable venue for producing this evolution. It might, therefore, be tempting to conclude that early modern universities, together with other formal and informal institutions, such as academies, religious schools, courts, and humanist circles, were among the main centers of Renaissance innovation.

Impact and Legacy

As we have seen, Renaissance universities had a tremendous impact on several areas of learning. Yet, they had an even bigger impact on early modern society. These institutions provided a major contribution to the emergence and dissemination of the Protestant Reformation. The starting moment of the Reformation was in all respects an academic exercise, a disputation on a specific topic. The 95 theses composed by Martin Luther

(1483–1546) in October 1517 were structured as an academic disputation, concerning the topic of indulgences, expected to take place at the local University of Wittenberg. Although the disputation never took place, the links between the university and the Reformation were nonetheless highly significant for its deeper implications. Indeed, the defense and the spread of the Reformation enormously benefitted from Martin Luther's position at the University of Wittenberg. His tenure as a professor of biblical studies lasted more than 30 years, during which he enjoyed the loyal support of his colleagues, who firmly backed his position. More importantly, Luther and his colleagues were able to gain the passionate commitment of many students, who became followers and then leaders of the Reformation. A considerable number of his students became university professors during the sixteenth century and spread Reformation ideas even further through the collaboration of their own students (Grendler 2004, 14–20).

Abstract

(XVI century), member of the Portuguese Hebrew nation, author of *Consolaçam às tribulaçoens de Israel*, first edition Ferrara 1553, second edition Amsterdam 1599

Biography

Little is known about Samuel Usque's life: recent archival findings situate his birth between 1500 and 1520 in Portugal (Wilke 2014). It is however clear that he lived and experienced one of the most troubled periods of Jewish history in Europe: the end of the fifteenth century and the first half of the sixteenth century. After the expulsion of the Jews from Spain in 1492, the king of Portugal John II (1455–1495) opened the doors of his kingdom to the exiles because he appreciated their talent in finance, tax administration, astronomy, and cartography. Nonetheless, he took their children from them and deported them to Sao Thomè on the African coast in order to have them baptized. His heir, Manoel I (1495–1521), set the Jews free. However, 1 December 1496, he issued a decree ordering the Jews and the Muslim to leave Portugal in the space of 10 months. The following year, he changed his mind and decided to force them to convert in order of being able to keep them and profit from their skills. According to traditional historiographic reconstruction, he acted so since he cherished the hope of marrying the Spanish princess daughter of Ferdinand and Isabel and uniting Spain and Portugal. Recent historiography has tried to challenge this assumption, which, however, seems to hold still its validity (Soyer 2007, 5–8). Thus, the Jews were turned into New Christians or, as they were commonly labeled, into Marranos; Jewish assimilation in Portugal had started. Nonetheless, the process was not as drastic and severe as it was in Spain. The members of this community ascended to a high level of wealth, and at the same time, they managed to preserve a double identity: they were Christians outwardly and officially; inwardly, they strove to preserve a secret allegiance to Judaism. Thus, they shaped for themselves an identity of their own and were called the *nação hebreia* (Hebrew nation) of Portugal (Yovel 2009). This ambiguity together with the wealth of the community did not remain unnoticed for long time. In 1506, the mob massacred the New Christians in Lisbon. In the wake of this massacre, Manoel's attitude changed, and he issued laws allowing some freedom to the Marranos. His successor,

John III, maintained these privileges. The Marrano community had the possibility of developing both from an economic and political point of view, and it knew a period of prosperity that came to an end in 1531, when the Inquisition was established in Portugal.

It is commonly assumed that Samuel Usque was a member of this Portuguese nation, a Marrano, whose Christian name remained unknown. His family came allegedly from the Spanish city of Huesca (Kayserling 1905, 387–388; Cohen 2002, 12). Usque possibly witnessed the Sao Thomè deportation, the massacre in 1506, and the establishment of the Inquisition (Cohen 2002, 13). According to Graetz, there is no doubt that he fled the Inquisition from Portugal and he succeeded in finding a safe harbor in Ferrara (Graetz 1998, vol. IX, 311). Recent archival discoveries locate Usque in Antwerp in 1543; from there in 1545, he arrived to Ancona where he claimed to be a Portuguese merchant. Later on, he moved to Ferrara. Legal documents attest his presence in Venice in 1548. A little afterwards, he came back to Ferrara and then he moved to Pesaro. In 1553, the text of the *Consolation* was published in Ferrara (Guerrini 2001). His relationship to Abraham and Salomon Usque has not been fully cleared (Cohen 2002, 14). Abraham Usque, however, printed the text of the *Consolation* in Ferrara in 1553.

Usque wrote his work in his mother tongue, Portuguese. Nonetheless, he had also command of Spanish and Latin, and he used these languages in order to access the original sources allowing him to compose an original work (Graetz 1998, vol. IX, 311–312). To these “languages,” Martin A. Cohen adds Greek and Hebrew and suggests that Usque may possibly have known some Italian and some French (Cohen 2002, 12).

Heritage and Rupture with the Jewish Tradition

The *Consolation for the Tribulation of Israel* is a historiographical work divided into three dialogues. The main character Ycabo tells the history of the people of Israel to the other two characters

Numeo and Zicareo. This history begins with the biblical origins of Israel, and it focuses on the countless tribulations Israel had to face since the fall of the First Temple until the author's present days. The last episode Ycabo narrates is the desecration of the Tora scrolls in 1553 in Pesaro.

Usque intended to address a very specific public, namely, the "Gentlemen of the Diaspora of Portugal" (Cohen 2002, 38). He dedicated them the prologue to the entire work, written in Portuguese to their benefit. In this prologue, he also explains that he aimed at consoling these people by reminding them that the past afflictions he recollects were much worse than the present ones.

The first dialogue begins with the description of a lost, golden age of pastoral life, where the children of Israel lived as peaceful shepherds and found their nourishment in honey and milk. The idyllic image is broken when a group of terrible shepherds arose from among the peaceful ones. They pursued different ways of life and decided to become hunters and to eat meat. The metaphor is explained by identifying the faithful shepherds with the Israelites that remained loyal to God. Then some of them became disobedient, they forgot God's commandments and were eventually punished because God sent several foreign peoples to conquer and devastate their land and to enslave them. The pastoral metaphor runs through almost the entire narrative and gives it a poetic accent. The lambs that belong to the flock of Israel are the persecuted; the hunters are the persecutors. The first dialogue ends with the fall of the First Temple. In the second one, Ycabo recounts the tribulations of Israel until the fall of the Second Temple. The third dialogue is possibly the most interesting one. There, Ycabo vividly describes the disgraces the Jews of Portugal had to face after 1492, namely, the deportation of Sao Thomè, the forced conversions, the Lisbon massacre in 1506, and the establishment of the Inquisition in Portugal.

According to Graetz, Usque is together with Yoseph ben Joshua Kohen (1496–1578) and Solomon ibn Verga (second half of the fifteenth to first quarter of the sixteenth century), an outstanding historiographer who, in the middle of the tragedies that engulfed Jews and Marranos, tried

to find in Jewish history the traces of the work of the providence (Graetz 1998, vol. IX, 306). He labels him "the poet," and he points out that his muse found her own very personal expression in the composition of his historical work and masterpiece. In Graetz's evaluation, Usque was familiar with biblical history, and he succeeded in the composition of the *Consolation* because he strived to access the sources firsthand (Ibid. 311). Nonetheless, Cohen has shown that Usque was not able to draw a distinction between reliable and unreliable sources (Cohen 2002, 19 and 269). Accordingly, he differentiated himself from his predecessors in his effort to access the sources firsthand, but he failed in developing a solid historiographical method.

It may however be argued that scientific historiography was not on Usque's agenda while he composed the *Consolation* (Cohen 2002, 19). His main purpose seems to be an attempt to try and make sense of all the tribulations. To this end, the literary pastoral metaphor remains central. Usque himself, in his prologue, explains the metaphor: Ycabo is to be identified with Jacob the patriarch. Numeo and Zicareo are the prophets Nahum and Zechariah disguised as shepherds and sent to God's command in order to remind the Jews the blessing they received in exchange for their suffering.

Ycabo's narration reconstructs the entire history of Israel in the context of a fall from a golden age stemming from the disobedience and unfaithfulness to God that started already in the biblical times. Israel's history narrated in the first and second dialogue and the Marranos' vicissitudes described in the third dialogue are thus parallel (Cohen 2002, 22). The Marranos' tragedies are a variation on this very same theme: the tribulations that happened in Spain and Portugal stemmed from the forsaking of God's commandments due to the forced conversions. From this point of view, Usque seems to hint at another crucial parallel between the destiny of the ten tribes and the destiny of the Marranos.

Usque interprets the history he is narrating from a religious point of view. The fall from the golden age can be rectified. If in his rhetorical strategy, each tribulation is followed by a

prophecy that indicates that the tribulation is the fulfilling of the prophecy and that the restoration of the lost golden age is not very far. According to Usque, the facts of Spain and Portugal are a proof that salvation is approaching, for the measure of punishment for Israel's and the Marranos' disobedience is filled up. The fact that some Marranos were already reverting to Judaism was the demonstration of this thesis.

From the point of view of the interpretation of history, Usque remains an intellectual figure immersed in the traditional mentality. However, his expectation of the upcoming salvation foreshadows the messianic wave that was about to overwhelm Jewish culture and society. Furthermore, the ambiguity of his Marrano identity, a mystery that has not yet fully unraveled, turns him into the embodiment of a figure of transition towards the modern intellectual and political world.

Impact and Legacy

Usque's work has failed to receive the attention it would have deserved by his contemporaries and those who came thereafter. The text of the *Consolation* is probably one of the sources of Yosef ha-Kohen's (1496–1575) *Emeq ha-bakha* (*Vale of Tears*, 1575) (Kayserling 1905, 387–388; Cohen 2002, 267) and of Gedalia ibn Yahia's (1515–1587) *Shalshet ha-Qabbala* (*Chain of Tradition*, Venice 1587) (Cohen 2002, 30). The text reached the Jewish communities in England and in Amsterdam where it was reprinted but with many errors. In 1640, the Inquisition forbade the reading of the *Consolation*. At the same time, the dwindling of the Usque's generation of Marranos also worked against the dissemination of the work (Cohen 2002, 31–33).

Among the scholars of the *Wissenschaft des Judentums*, Graetz attempted a serious examination of Usque's *Consolation*. Furthermore, the text was reprinted in Coimbra (Portugal) in 1906–1908. The Yiddish translation Elias Lipiner published in 1949 must also be mentioned. Nonetheless, Samuel Usque's personality and work still deserve and await more in-depth studies.

Ussher, James

Born: Dublin, 1581

Died: Reigate, 1656

Jack Cunningham

Department of Humanities, Bishop Grosseteste University, Lincoln, UK

Abstract

James Ussher was one of the first students at the newly established Trinity College, Dublin. He quickly went on to become the university's

most highly regarded graduate in the seventeenth century. An early appointment as Professor of Theological Controversies largely set the tone for the rest of his life, which was dedicated to winning the denominational argument with Catholicism by making reference to history. As a product of Trinity, he was a Ramist, and his encyclopedic approach to writing reflected this approach. Ussher would gather sources together in order to frame an argument, and his knowledge of ancient literature and languages was justly admired.

Ussher is perhaps most well-known for his *Annales veteris testamenti* (1654) which contained a dating of creation at 4004 BC that proved resilient up until the modern era and in some cases beyond. If Ussher's reputation suffers from this, then it is to be regretted because there is much historical work in *Annales* that is groundbreaking in its attention to primary sources and sedulous in its attention to detail.

Biography

James Ussher, Archbishop of Armagh, Primate of Ireland, and scholar was born in Dublin. The Usshers were a prominent Anglo-Irish family, Protestant, and well placed; his father was one of the clerks of the chancery and his uncle preceded him as Archbishop of Armagh.

Ussher entered Trinity College, Dublin in 1594 as one of its first scholars. Trinity was, from the outset, a decidedly Calvinist institution, and Ussher's theological formation left a stamp on not only his future writings but his approach to ecclesiastical administration. Ussher was ordained in 1601 and awarded his Doctorate of Divinity in 1612. At this stage, he had already been appointed as Professor of Theological Controversies. This role meant that Ussher's initial focus was on anti-Catholicism and his lines of attack were primarily theological and historical. Already the country's most prominent Protestant theologian, he was largely responsible for drawing up the Church of Ireland's Articles of Faith in 1615.

In 1621, Ussher was made Bishop of Meath and he resigned his professorship. If Ussher was a

rather reluctant Church leader, he was even more indisposed to a political life. However, he did manage to continue his scholarly activities, and in 1622, he published *A Discourse of the religion anciently professed by the Irish and British* which sought to establish that the Celtic Church's practices were congruent with those of the Reformed Churches. Ussher's fortunes continued to rise and he was elevated to the See of Armagh in 1625. In spite of his promotion, Ussher continued to write, and his 1631 book on the nine-century monk Gottschalk, who advocated a theology of double-predestination, was a thinly veiled attack on the Arminianism that was establishing a hold on the English Church (Ford 2007). In 1632, he produced *Sylloge veterum epistolarum Hibernicarum*, an outstanding work of antiquarian scholarship which brought together sources relating to the medieval Irish Church. The educational ethos of Trinity had been Ramist; this left an impression on Ussher's methodology which often involved him gathering his encyclopedic knowledge and collating it into well-organized categories in order to establish his points. His 1639 *Britannicarum ecclesiarum antiquitates* is a history of Christianity from its arrival in Britain to the seventh century. Although inclined to be over accepting of certain legendary accounts, the work has a good deal of historical merit. Once again, Ussher's great achievement is editorial as he managed to marshal an impressive variety of material.

Though well established as a Calvinist churchman, Ussher was also an ardent Royalist. This put him in a rather paradoxical situation in the 1630s as the two sides in the emerging civil wars can be roughly divided into Calvinist Parliamentarians and Arminian Royalists. Something of Ussher represented both sides and his tract *Reduction of Episcopacy* set out a compromise solution. When it emerged that few in England had much appetite for compromise, Ussher threw his lot in with the King's cause; in 1640, he left Ireland for England, never to return (Cunningham 2007). In England, Ussher was made Bishop of Carlisle and he continued his role as mediator between the warring factions.

During the Interregnum, Ussher was one of the few bishops allowed to continue their lives largely unmolested. When he died in 1656, it is testimony

to his standing among his political enemies that Oliver Cromwell paid for a state funeral (Cunningham 2007).

Ussher's contemporary notoriety, for the most part, rests on his dating of Creation in *Annales veteris testamenti* (1654). The date 23 October 4004 BC remained as a footnote to the Genesis account in Bibles for many centuries. That this notoriety is now almost exclusively negative is hardly surprising, but it is also a pity. The birthday of the world aside, *Annales* represents a considerable academic achievement demanding the ability to manage an impressive array of sources as well as a grasp of several ancient languages. It is worth noting that he is largely accurate in the dating of other significant events.

extensively taken up in writings on visual arts and provided one of the core concepts of poetics and art theories from the fifteenth to the seventeenth century. As a full theory of painting was not inherited from antiquity, the foundations of Renaissance art theory are largely based on terms and concepts derived from the classical rhetorical tradition and Aristotle's *Poetics*. The analogy between painting and poetry was either used instrumentally, in order to legitimize and consolidate the status of artists, or explored from a more sophisticated theoretical standpoint, against the backdrop of a dispute upon the relative superiority of the arts (*paragone*) through which the analogy was extended to sculpture. The concepts of imitation, idea, art, and beauty were the object of continuous redefinition in discussions pivoting on *ut pictura poesis*, fuelled by the established rhetorical practices of *ekphrasis* and *enargeia*. Despite the instauration of the modern system of the arts in the eighteenth century and the fundamental distinction between spatial and temporal arts (Lessing), *ut pictura poesis* continued to nourish the thought of artists, critics, and philosophers, culminating in trans-medial aesthetic experiences in the twentieth and twenty-first centuries. The influential methodological legacy of the “Sister-Arts” model, especially the assumed neutrality of a comparative approach to the study of art and literature, has been the object of profound revision and critique in the theoretical reflection of Visual Studies.

Heritage and Rupture with the Tradition

The major historical and theoretical fortune of the formula *ut pictura poesis*, “as is painting so is poetry” (Horace, *Ars poetica*, 19-10 BCE), interweaves with that of the sentence attributed to the Greek poet and mnemonist Simonides of Ceos (556-468 ca. BCE), “Painting is mute poetry and poetry is a speaking picture,” transmitted through Plutarch's *De Gloria Atheniensium* (I cent. CE). The comparison between poetry and painting through the centuries was most crucially applied in its inverse form (“painting is like poetry”) and

Ut pictura poesis

Federica Pich

University of Leeds, Leeds, UK

Abstract

The comparative notion of *ut pictura poesis*, “as is painting so is poetry” (Horace), although originally referred to literature, was

assumes an analogy between the two “Sister Arts,” whereas the parallel idea ascribed to Simonides emphasises a clear distinction of attributes while confirming the analogy: painting is associated with silence/dumbness and poetry with speech/voice (Barkan 2013).

The analogical notion condensed in the formula *ut pictura poesis* is close kin to a number of concepts inherited from ancient rhetoric and relevant to the relationship between the visual and the verbal, such as *enargeia/evidentia* (the stylistic effect by which a scene is brought vividly to the eyes of the listener) and *ekphrasis* (the graphic description of an object or scene). In fact, since antiquity theories and practices connected to *ut pictura poesis* developed at the crossroads between rhetoric, poetics, philosophy, and the art of memory (Bolzoni 1995; Von Rosen 2000). The organization and reception of both texts and images in the Middle Ages was essentially rhetorical (Carruthers 2000); however, it was in the works of fifteenth-century humanists that the categories of ancient rhetoric were explicitly adopted as concepts to describe and interpret works of art (Baxandall 1971). In the treatise *De pictura* (1435), a milestone in the history of art theory, Leon Battista Alberti built his discussion of the different parts of the process of artistic creation on the notions of *inventio*, *dispositio*, and *elocutio*, three of the canonical partitions of oratory according to Cicero and Quintilian. This fundamental adaptation proved very influential throughout the Renaissance and was later echoed, for instance, by Paolo Pino (*Dialogo di pittura*, 1548) and Lodovico Dolce in his *Dialogo della pittura intitolato l’Aretino* (1557), a defense and celebration of painting thoroughly informed by *ut pictura poesis* (Roskill 1968): Dolce distinguished *invenzione* (choice of subject and general plan), *disegno* (projection of *invenzione* into a sketch), and *colorito* (addition of color). The absence of a theory of painting inherited from antiquity encouraged writers to emphasize the definitions found in Horace, Plato, and Aristotle, and to transfer concepts developed with reference to the verbal media to the visual media, on an analogical basis (Lee 1967).

The analogy between poetry and painting was fundamentally grounded on their imitative nature,

their main subject of imitation (human nature in action), and their moral and didactic aims. Both arts perform an imitation but they do so through different means, words in the case of poetry and colors in the case of painting (Daniello 1536; Varchi 1550; Dolce 1557). In the high Renaissance, the idea of *ut pictura poesis* circulates across a diverse range of works and genres but is especially widespread in treatises on poetics (Robortello 1548; Minturno 1559; Scaligero 1561; Castelvetro 1570, among others), many of which stemmed from the Aristotelian revival of the 1540s (Graham 1973; Kristeller 1990); in fact, in most cases the parallel between poetry and painting can be traced back to a theory of *mimesis* (imitation) that combines the heritage of Horace and the rediscovery of Aristotle’s *Poetics* (Herrick 1946), often intertwined with elements derived from the Platonic tradition (Mendelsohn 1982). A similar syncretism is attested to by the long coexistence of two different concepts of imitation (literal and selective) both in treatises on poetics and in writings on painting: here art is described either as the perfect imitation of nature or as the imitation of a perfect model, derived from a selection of natural beauties or from an ideal beauty in the artist’s mind. This nontranscendental notion of “idea,” mediated by Cicero (*De oratore*), is comparatively more widespread than the metaphysical one (de Holanda 1548; Lomazzo 1584; Zuccari 1607), more orthodox in Platonic terms (Di Stefano 2007). The ambiguous opposition between natural and ideal beauty, between literal and selective imitation was often conveyed through the paradigmatic anecdote of Zeuxis and the girls of Crotone, which circulated widely not only in writings on art and poetry, but also in lyric poetry and dialogues on beauty and love (Trissino 1524; Nifo [1530]). The Aristotelian (art as imitation of nature) and the “Platonic” (art as imitation of the ideal) lines of thought developed for centuries as parallel theories, eventually joined in the work of Giovan Pietro Bellori: according to his *Idea del pittore, dello scultore e dell’architetto* (1664), the imitation of natural beauty, if understood correctly, should necessarily generate the supreme beauty of art (Di Stefano 2007). The notions of “icastic” and “fantastic” imitation (Giglioli 2010) were shared by theoreticians of

art and literature, among whom Tasso and Comanini, whose *Figino overo del fine della pittura* (1591) carries out a thorough comparison between poetry and painting, considering proportion and unity of action.

Innovative and Original Aspects

As opposed to the ancient and medieval exclusion of visual arts from the rank of liberal arts, the Renaissance enhanced their status and assimilated them to poetry, although without establishing a system of the fine arts based on a common principle.

The theoretical contribution of Alberti had a pivotal role in this process, as his *De pictura* fostered a new vision of the relationship between poets and painters by introducing the figure of *doctus pictor* (“learned painter”), whose knowledge and use of literary sources rescue his work from mere craftsmanship and enable him to relate to poets on equal terms. Alberti’s strong focus on *historia* (“id de quo agitur”, the painted narrative – a story taken from myth, literature or history) and the choice of a human action as subject imply a reflection on the moral aim of art and *decorum* (Lee 1967), as well as the assimilation of stylistic concepts of rhetorical origin (*varietas, gravitas*). Pomponio Gaurico (*De sculptura*, 1504) performs a similar adaptation of categories and compares sculpture to poetry, while taking up the example of Phidias, whose Zeus was allegedly based on Homer’s description. The idea of the superiority of artists depicting “istorie” will exert a major influence until the seventeenth century, culminating in the thought and work of Nicolas Poussin (Marin 1995; Cropper and Dempsey 1996) and the golden age of French classicism (Fumaroli 1998). The gradual separation of painting, sculpture, and architecture from the crafts was accomplished and made clear in the notion of “arti del disegno” (“arts of design”), developed by Vasari in his influential *Lives of the artists* (1550 and 1568) and through the creation of the Florentine Academy of the same name (“Accademia del disegno”, 1563). Later on, the model of the Accademia di San Luca in Rome (1593) was imitated by the French Académie Royale de Peinture et de Sculpture (1648), where

the parallel between painting and poetry was explored in significant theoretical writings (de Piles, Félibien, Le Brun). Roger de Piles translated into French and added comments to Du Fresnoy’s Latin poem *De arte graphica* (*L’art de peinture*, 1668); the work, which was based on Horace’s *Art poetica* and began precisely with the statement of *ut pictura poesis* and its influential reversal (“*similisque poesi sit pictura*”), was translated in England by John Dryden (1695), with the addition of a “Preface [...] with a Parallel of Poetry and Painting (Dundas 1993).”

In the Renaissance, *ut pictura poesis* evolves from the mere traditional parallel to a mutual relationship, without subordination (Corti 2004; Passignat 2017); simultaneously, an agonistic paradigm emerges alongside the analogical model, while the intellectual dignity of the visual arts is stated also on the basis of their kinship with scientific and mathematical knowledge (Hessler 2014; Ferrari 2019). Alberti himself celebrates Brunelleschi as the great inventor of perspective, so that in his *De pictura* the image of the learned painter – influenced by the literary model – coexists with the image of the artist as an insightful interpreter of nature and its laws, which has a significant fortune in the fifteenth century. Most famously, Leonardo da Vinci explores the relationship between poetry and painting from a new perspective, claiming the superiority of painting on the basis of the hierarchy of senses: the poet must represent objects by means of words, which reach the sense through the ear, whereas the painter can imitate forms themselves, addressing the eye directly (Leonardo 1995; Silver 1983). Born in the “occhio tenebroso” of imagination (Salvi 2012), poetry is confined to the mind of the poet, while painting is the object of sight, the noblest and most intellectual of senses, and the main source of human knowledge. Moreover, painting is immediate whereas poetry requires time to be read or listened to; as a consequence, the triumph of painting can be particularly evident in the case of the portrait, which renders physical beauty and offers it to the beholder with a truthfulness near to nature, and in the case of the visual depiction of a hectic battle, a scene that the slow pace of words would struggle to describe. The position endorsed by Leonardo is essentially

Aristotelian, as the act of seeing is an act of knowledge, whereas the opposed hierarchy could be supported from a Platonic perspective, arguing that painting cannot reach beyond the limit of the body and the visible. In prose writings on art from the second half of the sixteenth century as well as in poetic texts inspired by works of art, painting and poetry are associated respectively to the rendering of external (body) and interior beauties (soul and moral qualities). The distinction between poetry and painting therefore involves both imitation and reception: poetic and artistic imitation are exerted on different objects, perceived either by the soul or by the eyes (Varchi 1550; Castelvetro 1570), which are also their respective addressees – “in our souls” / “in front of our eyes” (Dolce 1557). However, this limit was frequently questioned, as for instance bodily gestures were considered to express “*motus animi*” and intentions (Alberti, Leonardo). Varchi himself, while establishing a clear correspondence between body and portrait, soul and sonnet (“the difference between poetry and painting appears to be as great as that which exists between the soul and the body” [trans. Mendelsohn 1982]), undermines this very distinction by stating that actually poets also describe external appearances (“what is outside”) and painters try to show “what lies within, namely *affetti*” (Varchi 1550). According to Lomazzo, who quoted several poetic examples in his *Trattato dell’arte della pittura, scultura et architettura* (1584), painting is most similar to poetry precisely in the expression of passions; furthermore, a poetic spirit shared also by painters would account for the fact that many artists were also poets, such as Bramante and Leonardo.

The agonistic comparison between the work of poets and that of painters was explored against a sophisticated theoretical backdrop in the mid-sixteenth-century debate on the relative superiority of arts known as *paragone* (Hendler 2013). At this stage, an intricate blending of Aristotelian and Platonic elements characterised the intellectual life of Italian academies; furthermore, not only had artists achieved a higher status, but many of them had been admitted to the academies and some were skilled poets in their own right (Michelangelo, Bronzino). On the one hand, it

would be simplistic to reduce the conceptual role of the parallel between painting and poetry to its self-promotional use by visual arts, because there is a deep and genuine connection informing the Renaissance discourse on the arts, mainly on rhetorical grounds. On the other hand, even treatises that explicitly focus on the comparison between painting and poetry (Gilio 1564; Possevinio 1593; Nunes 1615) do not examine it with the theoretical awareness and search for common principles that will be typical of later aesthetics (Kristeller 1990). The leading figure of the *paragone* is Benedetto Varchi, theoretician and poet, whose use of *ut pictura poesis* is not merely defensive, as he dwells on the practical side of the work of the artist and at the same time strongly highlights its affinity with literature and philosophy (Mendelsohn 1982; Varchi 2013). His influential *Due lezioni*, delivered in 1547 to the Florentine Academy and printed in 1550, concern respectively the process of artistic creation and the relative merits of painting and sculpture, resulting in a syncretic theory of visual arts whose sources are mainly literary and philosophical: lyric poetry and treatises on love and beauty, including Bembo and Leone Ebreo, in their turn influenced by Ficino and other Neoplatonic philosophers. The third dispute of the second lecture, which brings together painting and sculpture through the notion of *disegno* (design), is entitled “In che siano simili e in che differenti i Poeti e i Pittori” and evaluates painting and sculpture against the standard of literature; the discussion culminates in a defense of sculpture conducted by attributing to painting the inevitable falsehood Plato attributed to poetry (Mendelsohn 1982). The comparison between the poet and the painter could be extended to the sculptor through the idea of art as imitation of universals rather than particulars (Lee 1967; Panofsky 1968). As a rule, defenses of painting in fact focused strongly on the analogy with poetry (Dolce 1557), which Varchi reinterpreted at the service of sculpture.

The metaphorical association of sculpture with inner images (*imagini* or *concetti*) and of painting with external images occurs in lyric poetry, implying an explicit claim for the superiority of the interior representation, comparable to the idea in the mind of the artist, and hence an implicit – or

indeed explicit – claim for the superiority of poetry (Pich 2010). In the light of the double meaning of the Greek word *graphein* (“writing” and “painting”) and the Latin *pingere/pictura* (Carruthers 2000), metaphors derived from the work of artists were applied to rhetorical and literary phenomena since antiquity; in the vernacular tradition, this use is attested beginning with Dante Alighieri and Francesco Petrarca (Levi 2010; Zemanek 2010); in particular, Petrarca adapted rhetorical categories to the visual arts (*De remediis utriusque fortunae*; Perucchi 2014), while echoing the vocabulary of painting in his poetry. The success of this metaphorical use culminated in the reference to literary depictions, themselves building on pictorial metaphors, as recommended models for painters (Dolce 1557) and in the extensive use of architectonic metaphors in titles of literary works (*Tempio*, *Galeria*). In treatises, examples of the parallel between poets and painters were discussed either in terms of imitation – for instance, according to Varchi, Michelangelo would have imitated Dante in his representation of Hell in the Sistine Chapel – or in terms of style: (1553; Gelli 1887) compared Michelangelo to Dante and Flemish painting to Petrarca (or, more accurately, to Petrarchism) and Lenzoni (1556) argued for the superiority of Michelangelo over Raffaello, associating them with Dante and Petrarca, respectively, whereas Dolce (1557) adopted the opposite perspective, celebrating Raffaello-Petrarca (and Tiziano) against Michelangelo-Dante; Lomazzo (1584) focused on the assumed affinity that the genius of certain painters would show with the genius of certain poets, as in the case of Tiziano and Petrarca.

The model of *ut pictura poesis* informs other rhetorical and cultural practices which were familiar to both poets and artists and were the object of a remarkable revival that is peculiar to the Renaissance. On the one hand, the interest in *ekphrasis* was renewed by the model of Alberti, who in his *De pictura* built on Lucian’s description of the *Calumny*, a famous painting by Apelles, and by Vasari’s *Lives*, as well as by a number of translations and summaries from Lucian and Philostratus (de Vigenère 1597). On the other, an

important thread of the reflection on verbal and visual representation was reflected in the tradition of hieroglyphs, whose fashion, in connection with Neoplatonic wisdom, was revived by the publication of *Hieroglyphica* (1505), a treatise on Egyptian hieroglyphics attributed to the mysterious Horapollo, frequently reprinted and adapted over the century (Valeriano 1556). As opposed to the mediated form of verbal language, hieroglyphs were considered as a perfect language, conveying an immediate form of knowledge; they were interpreted in the light of Plotinus and Ficino’s idea of an original divine wisdom expressed in them (Gombrich 1948). As such, they were essential to the thought of Giordano Bruno (*De magia*, 1590), who believed they could provide access to the language of gods, and Athanasius Kircher (*Oedipus Aegyptiacus*, 1652–1654), who considered hieroglyphics a potential model for a universal language. The knot of verbal and iconic identified in hieroglyphs was at the basis of the widespread emblematic tradition (Alciato 1531), which was placed under the aegis of *ut pictura poesis*, materially featured on the title page of collections of emblems and *imprese* (Aneau 1552; Clements 1960). *Carmina figurata* (figure poems) and *imprese* (Giovio 1555), composed of an image and a motto, simultaneously embody and challenge Simonides’ opposition between painting as mute poetry and poetry as speaking picture, paving the way for numberless artistic experiments combining words and images across arts and media.

Impact and Legacy

A major watershed in the history of aesthetics is represented by the rise of the system of the arts (painting, sculpture, architecture, music, and poetry), which, although encompassing notions developed in the classical and Renaissance periods (Kristeller 1990), was established only in the eighteenth century, in the works of Batteaux (*Les beaux arts réduits à un même principe*, 1746). Whereas Dubos in his *Réflexions critiques sur la poesie et sur la peinture* (1719) examined both the similarities and differences between poetry and painting – stating a distinction between

the natural and immediate act of seeing and the mediated act of reading arbitrary signs, then taken up by James Harris (*Three Treatises*, 1744) – Batteaux applied the principles he derived from Aristotle and Horace (essentially imitation) not only to poetry and painting, but also to the other arts. In fact, the long-established centrality of *mimesis* could be undermined and replaced only later on, when the issue of representation became gradually less important than the problem of expression. Insightful criticism of both Batteaux and the notion of *ut pictura poesis* can be found in the writings of Denis Diderot, for instance in his *Lettre sur les sourds et muets* (1751). Despite the radical critique of *ut pictura poesis* carried out by Lessing (*Laokoon oder über die Grenzen der Mahlerei und Poesie*, 1766), who distinguished diachronic “arts of time” and synchronic “arts of space,” in his turn criticized by Mendelssohn and Herder (Lee 1967), the traditional parallel between poetry and painting continued to exert a major influence over the reflection of writers, artists, and philosophers, while offering inspiration to different artistic theories and practices.

The centuries-old reflection on the relationship between word and image and on the similarities and differences between verbal and visual expression lies at the heart of modern semiotics and influenced the development of modern Logic, through the tradition of the art of memory and the search for a universal language (Rossi 1960). However, the most conspicuous heritage of the debates revolving around *ut pictura poesis* can be traced in the theoretical field of iconology (Warburg, Panofsky, Gombrich) and Visual Studies. While acknowledging the realms of word and image as “two countries that speak different languages but that have a long history of mutual migration, cultural exchange and other forms of intercourse” (Mitchell 1996), Mitchell undermined both the traditional analogy between poetry and painting and the distinction argued by Lessing, by introducing the “theoretical figure” of “image/text” (Mitchell 1986, 1994). The traditional notion of painting as “dumb poetry” has been deeply questioned through the concept of *Bildakt* (Bredekamp 2010), while the Leonardo attack against the indirect imitation performed by poets has been countered through

the full acknowledgment of the “rhetoric” of images (Pfisterer and Seidel 2003) and of the visual dimension of verbal language. The problem of *ekphrasis* has also sparked the reflections of art historians on their own visual perception and critical use of description (Baxandall 1985; Arasse 2003, 2009; Clark 2006; Elsner 2010).

Utopia in Renaissance Philosophy

Christopher Martinuzzi

History Department, DePaul University, Chicago, IL, USA

Abstract

The term *Utopia* in Renaissance philosophy originates from and refers to Thomas More's 1516 work: *Libellus vere aureus, nec minus salutaris quam festivus, de optimo reipublicae*

statu sive de nova insula Utopia ("A truly golden little book, no less beneficial than entertaining, of a republic's best state and of the new island Utopia") (More T. In: Logan GM et al (ed) *Utopia*. Cambridge University Press, Cambridge, 2002). This literary sensation gave rise to a philosophical and artistic genre that would flourish in the late Renaissance and Enlightenment, extending into nineteenth-century ideologies, namely utopian socialism. The term contains within itself an ambivalence of meanings that relate to its two possible roots – *ou-topos*, meaning a nonexistent place, or simply no place; and *eu-topos*, referring to a good place. Calling upon ancient Greek philosophic and literary traditions, as well as the biblical model of the Garden of Eden, Renaissance utopias would often describe imagined, isolated (or geographically confined) political or religious communities that possessed clear attributes of perfection. Sometimes, mere literary and philosophical speculations, more often early modern utopias inserted themselves within the ancient Greek traditions of criticizing existing societies and institutions through dialogue, by imagining (and therefore suggesting) the most perfect model of political philosophy in terms of human relationship and collective happiness.

Heritage and Rupture with the Tradition

Renaissance utopias emerged from humanism and the rediscovery of Greco-Roman traditions, combined with the example of harmony provided by the description of the Garden of Eden in the Book of Genesis. In ancient Greece, the exercise of imagining the perfect *polis*, in all its urban, architectural, political, religious, and juridical elements, pertained to the realm of political philosophy. Though imagined, these perfect cities often represented true aspirations or simply described the best possible outcome for specific strategies and were not simple literary exercises. Though not necessarily focused on the analytical description of ideal *poleis*, Plato's *Republic* was seen as the archetype of Renaissance utopias

(Annas 1981; Plato 1992; Purshouse 2007, Roochnik 2003; Rosen 2005). In it, Socrates – along with various Athenians and foreigners – discusses the meaning of justice, examining whether or not the just man is happier than the unjust man. This is done by considering a series of different invented cities culminating in a perfect city called *Kallipolis* (beautiful-city), which is ruled by philosopher-kings. Furthermore, the literary model used by Plato of the Socratic dialogue would, in turn, be adopted by Renaissance utopian authors. The influence of the *Republic* on utopian literature combined, firstly, an emphasis on education as the preferred vehicle to universal good in political and juridical terms; secondly, the role of harmony (extracted from its musical and mathematical connotations) understood in societal terms, where all components and relationships are governed by the desire to do good and achieve perfection. In Thomas More's second book of *Utopia*, this is reflected in a meticulously defined order of his imagined society, from its political institutions all the way to familial relationships. Utopia's mainly agrarian society is planned in all of its manifestations through a system of checks and balances that spanned beyond its political institutions: its capital (Amaurot) is in the middle of the island and all other towns are equidistant from the center. Each city has 6000 households, consisting of between 10 and 16 adults, and elected representatives who in turn chose a prince. The latter can be deposed if suspected of tyranny. To keep a balance in the distribution of population across the territory, people are transferred around the households and towns to keep numbers even, and if the island becomes overpopulated, colonies are created on the mainland. Slavery is part of Utopian society, and every household owns two slaves. The slaves are either volunteers from poor neighboring countries or local criminals. For this reason, illicit activity is almost wholly absent on the island (Bruce 1999). The criminals are tied with chains made of the gold that belongs to the communal wealth of the country. More uses this feature, alongside the absence of private property on the island, to describe the moral shunning of earthly goods by the inhabitants of Utopia.

Imagined Geographies

Renaissance utopias were often set in imaginary landscapes influenced by a multitude of sources, from the Greco-Roman tradition to the Garden of Eden, but also by the many geographic and scientific discoveries of that age of great transformations. Greco-Roman antiquity provided two fundamental models in connection to the imagined geographies within which Renaissance authors would set their literary constructs: firstly, the model of an isolated or island community; secondly, the idea of a perfect age of harmony between nature, mankind, and the divine known as the Golden Age. For the first of these models, Plato is again the foundational source. He describes a self-contained and potentially perfect society in two of his dialogues: in the *Timaieus*, when writing about Atlantis, the original adversary of Athens; and in the *Critias*, where the mythical island (or continent) is presented as an ideal kingdom. The natural descriptions of the mythical island's geography would be mirrored, almost a thousand years later, by More's detailed portrayals of the civilization of Utopia (Plato 2008). The similarities between these two literary constructs (both rich in resources and natural beauty) can be noted in their mythical and divine origins, as well as in the harmonious political institutions that govern them. For this reason, and with the aim of making the existence of Utopia more plausible, More offers lengthy descriptions of the island's imagined geography. The myth of Atlantis, combined with the aspirations and hopes that emerged with the seventeenth-century Scientific Revolution, inspired Francis Bacon's incomplete utopian novel, *New Atlantis* (Bruce 1999; Price 2002). Published posthumously in 1627, this fictional island set in the southern Pacific Ocean was supposed to represent a place in which an ideal social organization had been achieved through the knowledge derived by science. An orderly and divinely-ordained monarchy called the "House of Solomon" rules over the island community of Bensalem. Combining Christian faith with the scientific advancements of his age, Bacon imagined an island community devoid of all tensions. As in More's case, this was meant to spark the curiosity of seventeenth-

century European readers by inserting subtle criticisms of the religious persecution of scientists of that age of revolution and technological advancement. Moreover, science was seen as the one true method to ameliorate human society. Thanks to More and Bacon's examples, the field of British utopian authors of the seventeenth century would be particularly rich (Boesky 1996). Following in this literary tradition, Gabriel Plattes used Plato's model of a dialogue to describe Macaria, an ideal island society that had previously been mentioned in both *Utopia* and *New Atlantis* (Price 2002; Webster 1972). *A Description of the Famous Kingdome of Macaria* was a short pamphlet addressed to the English Parliament. It was published in 1641, originally under the name of Samuel Hartlib. Henry Neville's 1668 *The Isle of Pines* also has an apparently idyllic island setting, but the work does not clearly fit within the boundaries of utopian literature (Bruce 1999). This island community does not present the traits that make Utopia, New Atlantis, and Macaria ideal, and should instead be seen as one of the first examples of literary dystopias (Beach 2000; Rutkowski 2003). Published in 1675, Denis Veiras d'Allais' *The History of the Sevarites or Sevarambi* also follows in the English tradition of a perfect island community set in distant oceans (Veiras 2006; Rosenberg 2001). A critique of the Catholic Church of the seventeenth century, this utopia set in Oceania would be translated into French, German, Dutch, and Italian, influencing the work of Bayle, Kant, and Montesquieu. Like Veiras, Gabriel de Foigny, a former Franciscan friar converted to Protestantism, also set his imaginary land in Australia. Published in 1676, *La Terre Australe connue* (*The Southern Land, Known*) describes an egalitarian society where all institutions (including governments) and religions are absent (Atkinson 2009; Foigny 1993; Marrone 2004).

In addition to the myth of Atlantis, further models that inspired Renaissance writers and artists interested in defining, describing, and depicting states of human perfection were the Greek notion of Golden Age and the Judeo-Christian tradition of the Garden of Eden. The Former, first emerged in the mythology of Hesiod

(eighth century BC), in particular in his didactic poem *Works and Days* (Hesiod 2008). The Golden Age was part of the Myth of Five Ages that defined the stages of human existence through a progressive decline known as "deteriorationism." During the first age, the Golden Age, humans lived harmoniously alongside the gods. Ovid and Virgil transposed this model to the Roman tradition, giving the Golden Age further attributes of perfection, such as justice and peace. In turn, these would be used by Renaissance utopian authors and found in the visual representations of artists such as Lucas Cranach the Elder, Robert Willemsz de Baudous, and Pietro da Cortona (Bloch 1989). Virgil, in particular, started the literary tradition of Arcadia, a mythical Greek region in the Peloponnese where mankind had supposedly lived harmoniously in a perfect state of nature. All of these myths also expressed the hope that the idyllic state had not irrevocably been lost and that it could be regained – an idea that in Renaissance Europe would merge with the model of the Garden of Eden, as well as Christian millennialism and eschatology. Michel de Montaigne described such a state of harmonious relationship between man and nature in his essay *On Cannibals*. The French intellectual combined the ancient Greek tradition with the travel literature that described the peoples of the newly explored regions of Brazil (Montaigne 1993). In turn, Montaigne's essay and new perspective on barbarism and the state of nature is considered to be one of Shakespeare's sources for the 1610 play *The Tempest*. This is particularly evident in the first scene of the second act of the play, where Gonzalo, trusted adviser of the king of Naples, describes a commonwealth set in a state of nature, which also echoes the medieval peasant myth of Cockaingne.

Montaigne's interest in the Americas, More's setting of his imagined island in the Atlantic Ocean, and Bacon's southern Pacific island show a clear dependency on the travel literature, diaries, and journals that described the lands that had recently been explored by European sailors. *Utopia* and *New Atlantis* alike begin with the description of a journey by sea in perilous and previously unexplored regions of the world. This was

followed by a detailed account of the imagined indigenous civilizations that lived there. Christopher Columbus and Amerigo Vespucci's journals provided accounts of non-capitalist societies that inspired sixteenth and seventeenth-century utopian works. Furthermore, Renaissance utopian literature was often accompanied by visual aids, such as maps or other illustrations of the imagined worlds. This demonstrates a dependency on early modern advances in cartography and exploration. The early editions of More's *Utopia*, for instance, contained woodcut illustrations of the crescent-shaped island designed by German artist Ambrosius Holbein, as well as a depiction of More's imagined narrator himself, Raphael Hythlodæus. The maps illustrate themes of order and symmetry that More used to describe his perfect society. Similarly, this visual representation of ideal worlds can be seen in the French tradition of the *carte de Tendre* (map of Tendre – an imaginary cartography supposedly leading to true love). Particularly representative of this style is François Tristan l'Hermite's 1659 *Carte du royaume d'Amour*. In it was the illustration of a map containing the directions that led to the path to true love. The fascination with cartography also drew on other traditions, such as the Judeo-Christian model of the Garden of Eden, which also influenced Renaissance imagined worlds, such as in the case of Athanasius Kircher's 1675 *Topographia paradisi terrestris*. Similarly, Heinrich Bünting's 1581 map of the world using a cloverleaf model (*die gantze Welt in ein Kleberblatt*) is a further testimony of Renaissance interest in designing imagined geographies with allegoric and deep symbolic meanings. The fascination with the cartography of imagined worlds, islands, and even simple cities can also be seen in the illustration of Anton Francesco Doni's city, from his 1552 work *I mondi del Doni* (Comparato 2005). His interest in this literary genre had been sparked by Ortensio Lando's Italian translation of More's *Utopia*, which Doni himself had edited and published in 1548. His fictional geography emerges especially in the short dialogue *Il mondo savio e pazzo*. In it an imagined narrator called Savio (the wise man) describes in the form of a dialogue to Pazzo (the

mad man) the best way for mankind to liberate itself from all tribulations and cares. In Doni's star-shaped city pain is entirely absent, as are all of the causes of human suffering, including private property and familial relations. Following Doni's model of a perfectly happy city, but also conditioned by Marsilio Ficino's Neoplatonism, Francesco Patrizi da Cherso's *La città felice* (*The Happy City*) (1553) is a further testimony to how widespread the utopian style had become in the Italian peninsula by the middle of the sixteenth century (Comparato 2005; Saitta 1966). Like Doni, though mostly focused on the balance of power amongst ideal political institutions, Patrizi was concerned with describing a harmonious city-State and may have been influenced by Niccolò Machiavelli (Muccillo 1986). The city-State model had been a successful one in the northern and central regions of the peninsula in the early Renaissance, and for this reason it would often be chosen by Italian authors as the ideal setting for their utopian societies. One such city can be found in Lodovico Zuccolo's *Il Belluzzi, o vero della città felice* (Zuccolo 1944). The influence of utopian literature on Zuccolo's work is especially noticeable in his 1625 *La repubblica d'Evandria*, seen as one of the first works of Italian political/science fiction. Nevertheless, the earliest example of Renaissance utopia set within city walls was the French fifteenth-century *Le Livre de la Cité des Dames* (*The Book of the City of Ladies*), by the female author Christine de Pizan. Finished in 1405, this allegorical work presents women as valued participants in society, advocating equal access to education for men and women alike (McCormick 2003).

The seventeenth-century Scientific Revolution would effectively broaden the scope of imaginary geographies, making them reach far beyond the models of idyllic islands or city-State societies, to include the sidereal realm. Probably inspired by Galileo's lunar observations and depictions, Johannes Kepler's *Somnium sive opus posthumum de astronomia lunari* (*The Dream*) uses the stylistic traits of utopian travel to describe the famous astronomer's scientific findings. Published posthumously in 1634 by his son Ludvig Kepler, the work did not define an ideal

political community, but was intended, rather, as a description of the astronomic and environmental conditions found on the Moon (Comparato 2005; Kepler 1984). Still falling within the humanistic tradition of a revival of ancient Greco-Roman knowledge, the *Somnium*'s sources were Lucian of Samosata's *Vera historia* (A True Story) and Plutarch's *De facie in orbe lunae* (Grewell 2001). Though lacking some of the fundamental elements that define Renaissance utopian literature, the *Somnium* would inspire a rich multitude of seventeenth-century novels that fall more clearly within the boundaries of that genre (Nicolson 1962). These include John Wilkin's 1638 *The Discovery of the World in the Moone*, Francis Goldwin's *The Man in the Moon*, also published in 1638 (Poole 2010), and Cyrano de Bergerac's 1657 *L'Autre monde ou les estats et empires de la lune* (*The Other World: Comical History of the States and Empires of the Moon*) (Alcover 2004; Comparato 2005). Furthermore, Kepler's *Somnium* has sometimes been seen as having initiated a branch of utopian literature that was not focused on earthbound societies, but on the endless multitude of planets and stars that he himself had contributed to discover: science fiction (Comparato 2005). Published in 1666, *The Description of a New World, Called The Blazing-World* by Margaret Cavendish also follows in this tradition. The only known work of utopian literature composed by a woman in the seventeenth century, *The Blazing World* describes a fictional world and satirical society that could be reached by journeying to the North Pole. Cavendish, probably influenced by her contemporary Thomas Hobbes, described an ideal and peaceful society ruled by an absolute and enlightened sovereign (Bowerbank et al. 2000; Khanna 1994).

Theocratic Utopias and the Role of Religion

If Plato provided the political model for later utopian thought, the religious and moral concerns of Renaissance authors would be inspired by different historical sources and events. Though varying in religious affiliation, most Renaissance utopias describe societies imbued with Christian ethics and moral norms. Published only one year before Martin Luther's *Ninety-five Theses*,

Thomas More's *Utopia* was not immune to the religious tensions that had already emerged across Europe in the fifteenth and early sixteenth century. The citizens of Utopia professed, for the most part, a form of deism that closely resembled certain aspect of Christianity. Though not originally a Christian nation, Utopia had rapidly taken to this religion after it had been introduced by explorers to the land. Furthermore, religious tolerance amongst all faiths and beliefs was of paramount importance on Utopia. Several religions were practiced on the island, including the worshiping of numerous celestial bodies. Monotheists and ancestor-worshiping also could be found on Utopia, and all were tolerated. Only atheism was rejected, as it was seen to be dangerous for the island itself and its communalistic system. (According to More, the moral implications of believing or not believing in an afterlife would affect the sharing of goods and the communal family system of Utopia.) Religious toleration, almost entirely absent in sixteenth-century Europe, was treasured in Utopia in the form of a universal prayer that all would recite. In More's ideal world, religious tolerance was paired with the possibility of peaceful religious persuasion and conversion. Inspired by Erasmus' irenic views, all forms of religious fanaticism were seen as unlawful on Utopia. In a similar spirit and as a reaction to the widespread violence of war in sixteenth-century Europe, More presented peace as a foundational value of his imagined society. Utopians did not engage in wars, unless in self-defense or to protect other neighboring nations from tyrannical rule. A typically humanist trait seems the glory bestowed to those who would achieve bloodless victories through other forms of persuasion. Nonetheless, when the utopians undertook military campaigns, they made extensive use of mercenaries, bounties, and assassination attempts. When forced to fight themselves, both men and women were permitted to go to war.

The central religious archetype for Renaissance utopias was the Garden of Eden as described in the Book of Genesis. The initial harmony between creation and Creator provided a model, not only for theocratic utopias, but for all idyllic descriptions and imagined geographies.

Utopian authors were also influenced by the spiritual crisis of the fifteenth and sixteenth centuries, namely the Protestant and Catholic Reformations and the events leading up to them, including heterodox movements that did not fall within the boundaries of institutionalized churches. Certain aspects of Renaissance utopias, therefore, derived not from the humanist rediscovery of Greco-Roman philosophic and political sources, but from medieval and early modern Christian traditions. On the one hand, these included the monastic and communalist life embodied by the early Benedictine order, followed by Dominicans and Franciscans of the thirteenth century. On the other hand, some were inspired by the fifteenth-century movements to reform the church in Bohemia and Moravia, which were often condemned as heretical. Furthermore, the Judeo-Christian ideas of the covenant between God and his elect people, as well as millennialist and chiliastic aspirations were sometimes adopted in utopian literature. These could also be found at the center of isolated religious communities that aspired to live perfect Christian lives on Earth. In their quest to create a-political, separate, and peaceful Christian communities, the Taborites and the Moravian Brethren sought to implement practices described in utopian works. Thus, the theocratic utopias of sixteenth-century groups such as the Swiss Brethren, Hutterites, and Mennonites became historicized (Stayer 2002): not imagined potential futures, but a concrete present where individuals worked toward the construction of a perfect Christian community. Persecuted by Catholics and Protestants alike, Anabaptists often found refuge in isolation and were guided by principles of equality and nonviolence. Emerging from similar roots the brief interlude of the Anabaptist kingdom of Münster was an experiment that called upon the construction of a New Jerusalem on Earth (Driedger 2016). Between 1534 and 1535 Anabaptists from the German states and the Dutch provinces, under the leadership of Jan van Leiden and initial spiritual guidance of Jan Matthys, forcefully expelled all Catholics and Lutherans from the Westphalian city and enforced Biblical law. Though short-lived, this experiment, often described in dystopian terms, was a representation

of influential aspirations of the time and can be seen as a symptom and symbol of a form of utopian theology centered on the idea of a celestial city built on Earth. New Jerusalem, in this context, was a model of divine perfection that could elevate humanity from its fallen state, an idea that originated from the book of Revelation 21:2. Just as the early-modern utopian *urbs*, the city described by the Apostle John was one rich in religious symbolism whose divine leader was none other than Jesus himself.

Christian utopias, as well as monasticism, especially in the early Benedictine order, possessed many of the qualities usually ascribed to utopias: separation from society, self-sufficiency, equality amongst a perfect community of virtuous believers. Nonetheless, they lacked entirely the elements of a fantastical and marvelous imagined world usually found in the literary exercises of Renaissance and Enlightenment utopian authors. Clear Lutheran elements and aspirations can be found in *Wolfaria*, the imaginary land described in the tenth and eleventh chapters of Johann Eberlin von Günzburg's 1521 *Fifteen Confederates* (Dipple 2014; Groag Bell 1967). The "Statutes of Wolfaria" express in a rigorous way the normative role of the utopian legislator (Comparato 2005), combining these traits with the tangible grievances of German peasants, as well as with Lutheran teachings. Like many Renaissance utopias, *Wolfaria* was represented as a pastoral and rural society where all contributed to the needs of the community through agricultural work. Like More, but clearly influenced by peasant articles of the 1520s, Eberlin was concerned with the nefarious consequences of an economic system entirely based on private property. Similarly, the model set by *Utopia* is evident in the emphasis put on education for both boys and girls, peace, and religious tolerance for Jews and heretics. The criticism of the practice of selling indulgences and of belief in their theological efficacy, as well as the emphasis on a rigid morality make *Wolfaria* a more typically Lutheran utopia. It represents one of the culminating cases of the so-called imaginative world of the Reformation (Matheson 2001), consisting of a widespread utopianism that could be found

in the context of sixteenth century German-speaking lands. Another example of utopian thought in the context of Reformation Germany was Johannes Valentinus Andreae's *Christianopolis* or *Reipublicae Christianopolitanae description*, published in 1619 (Dickson 1996). Skirting the boundaries of Lutheran orthodoxy, the German theologian claimed authorship of the *Chymische Hochzeit* (*Chymical Wedding of Christian Rosenkreutz*), a pivotal work within the esoteric Rosicrucian tradition. Moreover, in central Europe, utopian thought became integrated with popular reform movements, most obviously the German Peasants' War of 1525. This is evident in peasant demands and articles such as the *Twelve Articles of Memmingen* and Thomas Müntzer's *Eleven Articles of Mühlhausen*. More comprehensive works coming out of the Peasants' War have a utopian flavor; some of these include Friedrich Weygandt's *Draft of Imperial Reform* and the *Tiroler Landesordnung*, supposedly written by Michael Gaismair. The latter, penned in the final stages of the Peasants' War in Tyrol, describes an ideal and egalitarian society set in the pastoral context of the Alps (Politi 1995). Similar traits can be seen in *Von der neuen Wandlung eynes christlichen Lebens* (*A New Transformation of the Christian Life*, 1527), thought to have been written by Hans Hergot. Like the case of *Wolfaria*, Hergot's ideal Christian society envisioned the elimination of all monastic orders and was centered on millenarian expectations (Manuel et al. 1979). In 1524, the Saxon Reformer Thomas Müntzer actively attempted to create a new covenant between God and the elect in Allstedt. According to his plan, the small Thuringian town would be rebuilt as a utopian "Christian Nazareth," paving the way for a new and universal society were "omnia sunt communia" (Martinuzzi 2017 22). Similarly, radical economic stances based on a Christian understanding of society emerged more than a century later in the works of Gerrard Winstanley, especially in his 1652 *The Law of Freedom in a Platform*. In this instance, the theocratic utopia crossed the boundary into political activism, suggesting that a Christian society

could only be found in a state where property and hierarchy were absent (Bradstock 1997).

The most influential early modern theocratic utopia emerged from an entirely different tradition. Tommaso Campanella's 1623 *Civitas Solis* (*The City of the Sun*) calls for a pope-like supreme leader to rule over his imagined theocratic city. Campanella, a Dominican friar, theologian, philosopher, and astrologer worked on his utopian project after being imprisoned for rebellion and heresy in Naples. Next to traditional traits of utopian literature – such as the dependency on Plato's *Republic*, a detailed description of a peaceful urban society where all goods, women, and children were held in common – the Calabrese friar included prophetic visions and aspirations. Through the use of a complex net of astrological language and calculations, Campanella prognosticated that the Spanish crown, in alliance with the Papacy, was to be the instrument of the divine will on earth. Influenced by the conversion to Catholicism of the indigenous populations of the Americas, Campanella stressed how God's plan was for true faith to triumph across the world. Nonetheless, this work does not fall precisely within the boundaries of Catholic Counter-Reformation theology but reflects the religious and cultural tensions present in seventeenth-century Europe. The religious beliefs of the Campanella's imagined citizenry, even though they include fundamental principles of Christianity (such as the immortality of the soul and divine providence) form a natural religion that establish a sort of osmosis between the city itself and the Solar system. The *Civitas Solis*, whose name derived from *Sol* (Sun) – the high priest and prince who rules over the city – was thus a symbolic reflection of the religious aspirations and scientific discoveries of the time. As in many other utopias, education plays a pivotal role in Campanella's model society. By imagining a form of architecture of knowledge, he describes an *ante-litteram* open-access encyclopedia inscribed on the city's seven circles of defensive walls: first circle displays the laws of mathematics; the second, those of metallurgy, geography, and meteorology; the third and fourth, those of natural history, with illustrations of flora and fauna; the mechanical

arts appear on the fifth; history, war, and philosophy on the sixth; finally, religion and law on the innermost wall (Campanella 1981). Further ideal cities set within this religious tradition can be found in the earlier model presented by Ludovico Agostini in his dialogues on the *Infinito* (Comparato 2005, 77). Written after 1582, these dialogues present an idealized community set within a self-sufficient, closed, and heavily regulated urban context. The citizens of this Counter-Reformation utopia are forced to live a laborious, austere, frugal life where all games and dancing are prohibited. Education is functional to the program of social and moral regulation that aims at creating a community imbued with Christian virtues. Inspired by the model of monastic life, but freed from the rules on celibacy, was the imaginary abbey of Thélème described by François Rabelais in his 1532 novel *La Vie de Gargantua et de Pantagruel*. Next to other allusions to utopian literature, including a visit to Amaurot (the capital city of More's Utopia), Rabelais, a former Benedictine and Franciscan monk, described a model of a perfect community whose motto was: *Fay ce que voudras*. Turning the monastic model upside down, he denied any positive connotation to perpetual isolation and celibacy: all the citizens of Thélème were free to come and go as they pleased, and there were no laws or rules in this atypical abbey where men and women could marry (Rabelais 2018).

Innovative and Original Aspects

A typical trait of its humanistic origins is the literary innovations found in Renaissance utopias. A common element in this genre is the use of linguistic and literary devices to disguise the author's true identity and ideas, such as the use of the Socratic dialogue form. Fearing religious or political persecution, authors frequently published their works under pseudonyms, circulated their works as anonymous manuscripts, or devised literary constructs that could mask their more controversial and radical ideals. Thomas More, for instance, through the dialogue form used the narrating figure of Raphael Hythlodæus

(an invented explorer on Amerigo Vespucci's expeditions to the Americas) to disguise his ideas and to describe the ills of early sixteenth-century European society. This model allowed More not to claim ownership of ideas that could be considered dangerous. Raphael himself would define his political views as radical in connection to many practices and policies. These included a critical view of the bellicose tendencies of many European crowns, excessively violent punishments for crimes, widespread religious persecution, and the transformation of the agricultural landscape (namely the system of enclosing common land for sheep farming in England). In *Utopia*'s first book, More described the encounter with the traveler to whom he had been introduced while visiting the city of Antwerp. To further the plausibility of the true existence of the island of Utopia and of Hythlodæus himself, as described in the second book, More inserts letters between himself, Peter Gilles (town clerk of Antwerp), and Hieronymus van Busleyden (counsellor to Charles V) – both of them genuine historical figures. Raphael Hythlodæus becomes the medium through which More expresses his radical program of social reform, one that could hardly find a welcoming ear at the English court. *Utopia* followed the medieval and humanist tradition of how best to counsel princes. Similarly, Johannes Eberlin von Günzburg proposed a systematic way to educate a Lutheran prince in his 1521 *Furschlag* (Baldini 2010). Like More, when describing his fantastic kingdom of *Wolfaria* (from the term *Wholfahrt* meaning "all is well") Eberlin used literary constructs that could protect him from censorship or persecution. The *Fifteen Confederates* were, in fact, presented as a collection of pamphlets supposedly written by a group of laymen, and only in a later work would Eberlin admit authorship. The work also addresses the religious, social, and economic issues that the Southern German lands faced in the dawning years of the Reformation. The tenth and eleventh *Bundsgenossen* (confederates) contain respectively the *New statutes concerning reform of the spiritual estate which Psitacus brought from the land of Wolfaria*, and *A new ordinance concerning the secular estate written in Wolfaria*,

as described by Psitacus. Both ordinances of Eberlin's ideal secular and spiritual estates were described by two confederates, or commoners, who, in turn, had heard about Wolfaria from a parrot named Psitacus (itself the Greek term for parrot). On the one hand, the more controversial aspects of this work were the abolition of all religious orders and a clear Lutheran attack on indulgences. Worried about religious persecution, Eberlin used this triple layered precaution that included the anonymous circulation of his work, the use of imaginary narrating figures, as well as talking animals. On the other hand, the elements of social radicalism (such as his egalitarianism and the idea of an education open to all) might have simply been seen as the philosophic speculation of a humanist, and might not have encountered as much resistance had it not appeared only a few years before the 1525 German Peasants' War. The persecution of religious nonconformists and of those exploring the new worlds of science reached an apex when Giordano Bruno was burned at the stake in Rome in 1600. For this reason, many seventeenth-century scientific works would be circulated in manuscript or published anonymously. For instance, Johannes Kepler never published the utopian work he had first composed around 1610. The *Somnium* was only published posthumously in 1634 by his son. Kepler incorporated religious arguments and reasoning, guided by the belief that God had created the universe according to an intelligible plan that was accessible through the laws of science; he wished to provide a form of celestial physics that aimed at completing Aristotle's *Metaphysics* and treatise *On the Heavens*. Although he made use of strong autobiographical references, Kepler also used an invented narrating figure, a young Danish traveler called Doracotus, to create an extra layer of separation between this work and himself. The *Somnium* described that Doracotus had learned astronomy from none other than Kepler's own teacher Tycho Brahe and had come into contact with the lunar spirits only thanks to the help of his witch-mother Libussa (Kepler's own mother had been accused and tried for witchcraft twice in 1615 and 1620). Despite its utopian connotations, Kepler's aim was not that of promoting an ideal

political system or perfect society. Rather, by following a typically humanist tradition, he was interested in inserting his scientific findings within a compelling literary context. Science also played a fundamental role in forging Francis Bacon's utopian island community of *New Atlantis*. Like the *Somnium*, *New Atlantis* was only published posthumously in 1626 and appeared as a short insertion in a larger work on natural history, the *Sylva sylvarum*. In Bacon's imagined island, the enlightened political elite of Bensalem corresponded to deeply knowledgeable scholars that used science for the general advancement of society. Like the *Somnium*, Francis Goldwin's *The Man on the Moon* was also published posthumously in 1638. It described a lunar travel and was greatly influenced by Galileo Galilei's *Siderius numncius*. Set in the Elizabethan age, an age of religious conflict between Protestants and Catholics, *The Man on the Moon* described the journeys of a Catholic Spaniard, narrator of this utopian work, that scholars have taken to signify Goldwin's opposition to the censorship of Catholic works in England at the time. A more notorious English utopia that faced political censorship was James Harrington's *The Commonwealth of Oceana* (Harrington 2008). Published during the years of Oliver Cromwell's republican rule, Harrington's work bridged traditional Renaissance utopias with Enlightenment works of imaginary worlds and times, providing the model for eighteenth-century utopian practices, and far beyond. Because of its call for a balanced government, the work was initially censored by the Lord Protector. It was eventually published in 1656 with a dedication to Cromwell himself. Because he favored the political and economic system of a democratic republic, Harrington found enthusiastic readers amongst American republicans and French revolutionaries. From the mid-seventeenth century, utopian literature faced increasing hostility from absolute rulers that did not tolerate the radical political aspirations of its authors. For instance, the novel *Les Aventures de Télémaque* was published anonymously in 1699 as an attack on the French crown. The author of this utopian work has been identified as François de Salignac de La Mothe-Fénelon. Archbishop of

Cambrai (Fénelon 1994, 2017), Fénelon had been banished to his diocese by Louis XIV for religious and political reasons. Recounting the travels of Telemachus, son of Ulysses, the novel was recognized at the time of its publication as a critique to the sovereign's despotic rule. *Les Aventures de Télémaque* had a long-lasting influence on enlightenment and revolutionary figures such as Montesquieu, Jean-Jacques Rousseau, and Thomas Jefferson because it denounced war, luxury, and selfishness, elevating the brotherhood of mankind and altruism as supreme values.

Impact and Legacy

The island of Utopia paved the way for an *antelitteram* communalist economic model that ultimately would inspire eighteenth- and nineteenth-century utopian socialist thinkers, such as Henri Saint-Simon, Charles Fourier, and Robert Owen (Robertson 2019). Utopian socialism, for the most part, transferred to the realm of reality elements that had merely been theorized within the tradition of Renaissance and early-Enlightenment utopian literature. For this reason, next to the ideals of the French Revolution, utopian socialists often advocated communal or limited forms of private property, emphasized the importance of education, opposed war and violence, and actively promoted the creation of isolated and self-sufficient communities. More's model did not contemplate any form of private property describing a mainly rural and self-sufficient society. All goods were held in common in Utopia and distributed according to necessity; even homes were subject to rotation amongst citizens every 10-year period: "Thus I am wholly convinced that unless private property is entirely abolished, there can be no fair or just distribution of goods, nor can mankind be happily governed. As long as private property remains, by far the largest and best part of mankind will be oppressed by a heavy and inescapable burden of poverty and anxieties" (More 2002 39). Similarly, Eberlin's *Wolfaria* (influenced by the peasants' requests of his time) was a rural society, where the exercise of economic activity was strictly regulated. Though

set in an urban context, Campanella's *Civitas Solis* also imagines a society free from private property, where everyone is dressed in white (More also talks of the simplicity of the uniform-like clothing that all members of society wore) and eats in communal refectories. More's influence on later utopian systems can also be seen in the emphasis placed on the role of education. Similarly, Eberlin would stress the importance for an equal access to education for all from a young age. Learning from this tradition through the mediation of a second wave of utopian literature rampant in the Enlightenment, Charles Fourier's *Phalanstère* would transpose More's pastoral and egalitarian ideals to eighteenth- and nineteenth-century France and beyond. Fourier rejected the production models of the Industrial Revolution in favor of a society where wealth was held in common and education for all was seen as fundamental value. Conversely, Robert Owen, a British textile manufacturer and social reformer, integrated the utopian tradition with the new means of production recently emerged, thanks to the process of industrialization. Owen did so by actively participating in the British political life to improve the working conditions in factories and openly trying to limit and abolish child labor. Owen's utopian ideology of social reform was reflected in his political activism and in the creation of experimental communities, such as New Harmony in Indiana. These (often short-lived) communities were meant to be rural and self-sufficient, yet strongly dependent on mechanized work. Both Fourier and Owen's models would be used to create religious and secular utopian communities in the United States, such as Utopia in Ohio and the North American Phalanx in New Jersey.

Vacuum in Renaissance Science

Simone De Angelis
Zentrum für Wissenschaftsgeschichte,
Karl-Franzens-Universität Graz, Graz, Austria

Abstract

As a phenomenon, the vacuum has been associated with metaphysical, theological, and physical issues since antiquity. Aristotle denied the existence of vacuums in nature, since any vacuum would render the movement of bodies impossible. In the seventeenth century, the vacuum experiments conducted by Torricelli, Pascal, Mersenne, Boyle, Hooke, and Huygens became a paradigm of new contemporary physics.

Synonyms

Void

Innovative and Original Aspects

Both the historical and the current physical problems associated with a vacuum can be illustrated by a simple experiment: One puts a burning tea light on a saucer and places a glass upside-down over the tea light. As the tea light is burning, the

saucer is filled with a small amount of water. Soon, the burning flame will die, and the water will be sucked into the glass. This experiment poses two central questions: (1) What keeps the water column in place? And, (2) what is the nature of the space above the water column? Is it air-evacuated or filled with a “subtle fluid”? Nowadays we know that the flame consumes the oxygen inside the glass, thus generating a rapidly cooling gas which causes the pressure inside the glass to drop. Hence the water appears to be sucked into the vessel by a vacuum. In fact, the water is, however, forced into the glass by the higher-pressure air on the outside.

Seventeenth-century vacuum experiments are regarded as a paradigm of new physics: In a 1643 experiment very similar to the one outlined above, Galileo’s student Torricelli generated a vacuum by means of a barometer, using mercury instead of water. In 1646, Marin Mersenne and Blaise Pascal successfully reproduced Torricelli’s experiments, presented them to the public, and promptly published the results in 1647. Especially Pascal’s experiment on the Puy de Dôme volcano in the low French mountain ranges was to become famous, demonstrating that the height of the mercury column depended on the weight of the air (Wootton 2015; Caverni 1891).

This indicated important differences compared to sixteenth-century vacuum experiments: It had, in fact, been argued since Heron of Alexandria (first century A.D.) that extracting air from a tightly closed vessel could – at least

artificially – create a vacuum. However, the Aristotelians’ (Toletus, De Soto) and the anti-Aristotelians’ (Telesio, Patrizi) debate for and against the creation of a vacuum was merely concerned with carrying out thought experiments and repeating the *experimenta* known from antiquity and the Middle Ages. It therefore remained unobserved that to generate a vacuum, ice expands rather than contracts in a closed vessel, the latter having been falsely claimed by both parties (Schmitt 1967).

Between the thirteenth and seventeenth centuries, the water’s upward movement was, moreover, substantiated by theological and metaphysical arguments. Since, according to Aristotle, water and air merely have relative weights, it was conceivable that water tends to move downward with regard to its species, while it tends to move upward with regard to its genus. Paolo Veneto considered the latter the case when the superordinate aim of nature is to avoid a vacuum. According to this theory and following the teleology of nature’s “principle of subordination,” the “physical nature” is therefore subordinate to “universal nature” (Manzo 2013; Grant 1981).

The discussion of the vacuum in later centuries was, in fact, initiated because of Aristotle (*Phys.*, 4.8) who denied the existence of any kind of vacuum in nature for reasons relating to his theory of motion; the most important being that, in principle, a vacuum would render the movement of bodies impossible (Sorabji 1988). Galileo, on the other hand, did, indeed, assume the existence of movement within a vacuum by hypothesizing – and thus establishing the law of falling bodies – that in a vacuum all bodies fall at the same speed, irrespective of *impedimenti* (i.e., the type of matter, weight, friction, or air resistance) (Palmieri 2005).

The purpose of constructing the air pump in the 1660s was, in principle, to test Torricelli’s experiments. While Boyle and Hooke removed the air around the water column, thus causing the column to drop (which supported the vacuumists’ argument), Huygens’ water column remained in “anomalous suspension,” which Boyle and Hooke attributed to the fact that the air remained in the vessel (Shapin and Schaffer 2011). Huygens’

explanation for Boyle’s experiment, on the other hand, was the presence of air in the water column. As it was pressed out of the water, forming bubbles, the air accumulated in the upper space of the vessel and pushed the water down (an argument in favor of the plenists). Ultimately, the reproduction of these experiments with present-day vacuum pumps shows that Huygens’ “anomalous suspension” is to be explained by the fact that his water column consisted of *airless water* (i.e., that the air had been removed from the water prior to the experiment) and that the generated water vapor alone did not suffice to push down the water (Nauenberg 2015).

Abstract

Joachim Vadianus (von Watt) was a significant representative of Viennese humanism and Lutheran reformer of St Gallen. His writings fall roughly into two groups: literary and scientific works from Vienna, written in Latin for the university and the court; and Reformation writings from St Gallen, mostly in German.

Biography

In 1501/1502, Vadianus enrolled at the University of Vienna, where he studied with Conrad Celtis. After graduating as BA (1504), he worked as a schoolmaster at Villach and traveled to Italy and St Gallen, before returning to the University of Vienna, where he received his MA (1508), taught Latin literature, poetics, and geography; attended classes in astronomy and medicine, and served in various administrative posts, including vice-chancellor and rector of the university. He maintained a close association with Celtis and his circle, including Cuspinianus and Tannstetter (his correspondence, edited by Arbenz 1890–1913, attests to his wide circle of associates). Among Vadianus' students was Philipp Gundelius, later secretary to Matthäus Lang and counsellor to Ferdinand I von Habsburg. In 1514, Vadianus received the poet's laurel crown from Maximilian I. In 1517, he was awarded his MD.

During his time in Vienna, Vadianus wrote and published religious poetry, satires against scholasticism, poems commending the works of others, humanistic homilies, orations given at princely

diets, and panegyrics in honor of Friedrich III, Maximilian I, Sigismund I of Poland, and Vladislav of Bohemia. His lectures on Pomponius Mela formed the basis of a published commentary (1518) containing excurses on various topics. In 1515, he published his correspondence with Rudolf Agricola the Younger on the discoveries of recent explorers. While at Vienna, he also edited several classical, medieval, and humanistic texts (full details in Schirrmeister 2013).

Vadianus' most significant early work is a treatise on poetics (published 1518), based on lectures given in 1513/1514. Going beyond mere rules of versification, he discusses the origins (mythological, historical, and theological) and dignity of poetry, drawing on contemporary Italian humanists and philosophers such as Ficino. He treats matters such as inspiration, talent, and *numerus* (number, rhythm, and meter) and assesses several ancient and contemporary authors. For Vadianus, poetry presupposes broad and deep knowledge, and encompasses all branches of human learning (text, translation and commentary in Vadianus 1973–1977).

In 1518, Vadianus was appointed as city physician of St Gallen (see Näf 1944–1957 for Vadianus' activity at St. Gallen). Soon afterward, he contributed to a collective panegyric on Switzerland with Heinrich Glareanus and Oswald Myconius and published a work on the plague. As his Vienna circle dispersed, Vadianus maintained ever fewer of his old contacts (see Arbenz 1890–1913). Friends, including Zwingli, tried to attract Vadianus to Zurich, but his election to the town council of St Gallen in 1521 bound him even more closely to his native city. Vadianus was elected mayor of St Gallen in 1526, and many times subsequently. Beside his political offices, he practiced medicine until his death but failed to combine both functions in reforming the municipal health service. Although Paracelsus practiced medicine at St Gallen from 1531 to 1533 and dedicated his *Opus paramirum* to Vadianus, there is little evidence of much contact between them.

Vadianus was greatly influenced by Luther, and he worked to introduce Lutheranism to St Gallen while mediating politically and

theologically with Zwinglian theologians. Vadianus wrote against Anabaptism, despite being married to the sister of the Anabaptist leader Konrad Grebel, and he refuted the Spiritualist Caspar Schwenkfeld's conflation of the two natures of Christ. In 1536, he wrote a work on the eucharist, a doctrine that divided Catholics, Lutherans, and Zwinglians. Among his unpublished works are a treatise on prayer, writings on monasticism, and an examination of the doctrine of Christ's descent to hell as expounded by the Christian creeds, which draws on Valla, Pico, and Erasmus.

Many of Vadianus' writings from St Gallen represent a northern civic humanism, and they build upon his earlier interest in history and geography. He used the library of the abbey of St Gallen, especially for his historical works, and saved some of its oldest documents during a Protestant attack in 1531. He also arranged for other evangelical scholars to use the library, though this sometimes led to disputes with the abbot. In 1534, he published a work on geography, including a description of the places described in the New Testament. This work was based on lectures on the Acts of the Apostles which he had delivered at St Gallen. Among his later unpublished writings are chronicles of the monastery and city of St Gallen, and fragments of a history of the fall of the Roman Empire, the rise of the Church, and the Frankish Kingdom.

Most of Vadianus' richly annotated books are still preserved in St Gallen, though some volumes were stolen by Melchior Goldast and ended up either in the University Library in Bremen or the Vatican Library. The reception of Vadianus's works in Catholic countries was hindered by the fact that they were placed on the Index.

Abstract

The Spanish humanist Juan de Valdés made a significant contribution to sixteenth-century thought in the two areas of linguistics and theology. Raised in a family of converso descent, he studied at the University of Alcalá de Henares, and he spent the last decade of his life in Italy, where he wrote most of his works. His writings, with one exception, remained unpublished in his lifetime, but they circulated widely in manuscript during the sixteenth century and exercised a hidden but notable influence on his contemporaries in Italy, Spain, and Northern Europe.

Biography

Biographical information on Valdés is patchy, fuzzy, and, to some extent, conjectural. There is no consensus on the year of his birth; the dates that have been considered by scholars range from 1490 to 1510. The year of his death is not known for certain either (it ranges from 1540 to

1542, although there is a near-consensus on 1541). Even the date of composition of the *Diálogo de la lengua* is not known with certainty (it has been placed between 1533 and 1536, even though the vast majority of scholars agree on 1535). Other types of blurred information about Valdés include the following: the year in which he left Spain; his early stay in Rome and Naples; if he never again set foot on Spanish soil for the rest of his life, although recent research has had evidence to the contrary (Crews 2008; Anipa 2014); and the precise nature of posts that he held during his residence in Naples (recent archival evidence has shown that he worked, among other things, as a secret agent for Charles V (Crews 2008). Uncertainties persist about the origins of the Valdés family that settled in Cuenca, in the Middle Ages; they are believed to have come from either Asturias or Leon, but their roots have also been traced to twelfth-century England, from where they were constrained to migrate, due to nasty feuds in the royal circles where they belonged (Calvo Pérez 1991). And whether Juan was a twin of his brother Alfonso remains uncertain (scholars' views range from near-certainty to strong doubts). Thus, the biography of Valdés remains an unfinished business.

The primary biographical information on Valdés that can be said to be known for certain includes the following: Juan was born in Cuenca to Hernando de Valdés and María de la Barrera (both from noble family backgrounds); he had ten siblings – six males and four females – (Crews 2008) (earlier Renaissance scholarship had reported only four siblings); he had a converso ancestry, particularly on his maternal side but also on his paternal grandmother's side; he spent his youth in the service of the Marquis of Villena and was tutored by Pedro Ruiz de Alcaraz; he studied at the University of Alcalá de Henares under famous humanists, such as Juan de Vergara, and corresponded with Erasmus of Rotterdam. We also know that, in Rome, Juan was a chamberlain to Pope Clement VII and served three cardinals, roughly between 1531 and 1534, before settling in Naples, where his teachings attracted a distinguished group of aristocrats, theologians, and

humanists. There he composed most of his major works. He died in 1541.

Writing on Language (K. Anipa)

Presenting the writing of Juan de Valdés (henceforth “Valdés”) on language is not a straightforward affair. First, almost all of his writings were on religious themes, with the only one on language being the *Diálogo de la lengua* (henceforth “the *Diálogo*”), and second, from the time of its first publication (Mayans y Siscar 1737), the status, subject matter, and purpose of the *Diálogo* became debatable, whereby some scholars believed that it was literature-cum-literary critique, some that it was linguistics, others that it was both, others that it was neither (but rather only a set of trivial scribbles not of much intellectual significance), and others that it was a manual on the Castilian language, but essentially meant to help Valdés's Italian followers understand his religious teachings better (Usoz y Río 1860; Perry 1927; Montesinos 1928; Lapesa 1940; Barbolani 1967; Lope Blanch 1984). Over the past couple of decades, however, those uncertainties and undeclared schools of thought surrounding Valdés's writing on language have changed substantially. It has gradually emerged that the *Diálogo* was, essentially, a sociolinguistic treatise steeped in the ideology of language and nation and efforts at language standardization, aimed at developing and codifying a national language for the Spanish Empire; consequently, the work dealt with a number of topics within macro-sociolinguistics, micro-sociolinguistics, stylistics, and, to a much lesser extent, literary criticism. From the late twentieth century, it has become almost inconceivable, in Valdesian scholarship, to understand and interpret the *Diálogo* outside of these key dimensions.

Macro-sociolinguistics

The Renaissance linguistic debate that emerged in fifteenth-century Italy did not take long to spread to other nascent States in Western Europe. An

important aspect of that humanistic fervor was that of the quest for the origins of nonclassical languages. In Spain, the earliest thoughts on the subject were those of Alonso Fernández de Madrigal, in the first half of the fifteenth century, and Antonio de Nebrija (the father of Spanish humanism), toward the end of the century, although those early thoughts were quite sketchy in their nature and scope. Valdés's contribution, in contrast, was much more elaborate, as he carefully thought through the issue, including how his own knowledge of the subject had had to be modified, with time. And, in spite of drawing largely the same conclusion as his predecessors (that Castilian was primarily a deformed version of Latin), Valdés made a crucial difference in his consideration of the linguistic picture of Spain by incorporating into his thought the linguistic picture of the Iberian Peninsula, prior to the Roman invasion and introduction of Latin; in other words, he adopted a more holistic approach, as he worked through the diachrony of what eventually became Castilian.

Later in the sixteenth century, the debate was rekindled and significantly expanded by Florián de Ocampo and Alejo Venegas del Busto. With time, two main schools of thought developed: first, the Primitive Castilian Theory (propounded by Gregorio López Madera, which attracted many adherents, including Luis de Cueva, Francisco Bermudez de Pedraza, Tamayo de Vargas, Bartolomé Ximénez Patón, and Gonzalo Correas). Madera rejected the theory of deformed Latin as a viable explanation for the origins of the Castilian language. He firmly believed that Castilian existed in primitive forms right from the time of the first human settlements of the Iberian Peninsula, traced to Tubal (fifth son of Japhet, son of Noah). Madera based his theory on archaeological finds (relics, inscriptions, and manuscripts on parchment, partly written in Castilian) from the Monte Santo of Granada; the writings were attributed to Saint Cecil, disciple of Saint James, patron saint of Spain. Later, a fully-fledged Deformed Latin Theory (led by Bernardo de Aldrete and his collaborators) was developed, in order to counteract the Primitive Castilian one. As the sixteenth century wore on, an offshoot of Madera's school, the Euskadi Theory (advanced

by Lucio Marineo Sículo and such followers as Fray Domingo Valtanas, Esteban Garibay, and Andrés Poça), entered the fray; their argumentation was that there was, indeed, a primitive Castilian, but that it was Euskera. The heated debate lasted decades (Bahner 1966). Eventually, it was the Deformed Latin Theory that won the day. The significant merit of Valdés's treatment of the subject is the fact that he reflected on the bulk of the above aspects, including the Euskadi Theory, several decades prior to their fullest configuration.

Multilingualism, both as a universal sociolinguistic reality of every society (Hudson 1996) and as specifically applied to Spain, was a subject of interest to Valdés. He identified five languages in use in Spain – Castilian, Catalan, Valencian, Portuguese, and Vizcayan – before proceeding to explain a set of theories, based on geopolitics, linguistic borrowing, and variability caused by everyday language usage, all of which bring about multilingualism in States. It is to be noted that Valdés's inclusion of Portuguese among the languages used in Spain may not have had any imperial motives (Portugal having been a separate polity since late eleventh century), but that it had more to do with the fact that he viewed the geographical area as a single region in the form of the Iberian Peninsula. The later Iberian Union (1580–1640) can be understood as exemplifying that viewpoint; likewise, Valdés's assertion that typical Castilian words used among the nobility could be found in the language of the king of Portugal (Anipa 2014) must be a testimony to that conceptualization.

Valdés's thoughts on multilingualism are very much in line with modern sociolinguistic insights; in that discussion, he transcended linguistic scholarship of his time by covering what modern sociolinguists characterize as “a-type” and “b-type” levels of multilingualism (Coupland and Jaworski 2009), as well as “broad diglossia” (Fasold 1984). He, then, shifted his discussion to the specifics of the languages of his State, characterizing their crosslinguistic features as follows: Vizcayan, which he duly identified as an isolate, had lexical borrowings from Latin, but subjected them to such severe phonological nativization that they had become unrecognizable; Catalan had loaned

words from Latin, French, Castilian, and Italian; Valencian was close to Catalan, except for its phonology, but was still closer to Castilian; Portuguese had borrowed from Castilian much more than any other language and, as a result, was closest to it, apart from grapho-phonological features; Castilian was spoken even in Aragon and Navarre, and the linguistic and historico-geopolitical circumstances of the two kingdoms were comparable to those of Andalusia and Murcia.

With respect to crosslinguistic communication and the task of meaning transfer from one language to another, Valdés discussed serious difficulties involved in translation. Notwithstanding his concentration on the national language ideology and well in contrast to Charles V's famous proclamation, in Rome, of Castilian as a superior language, Valdés argued for equality of languages, declaring that all natural languages had the same natural capacity; his linguistic philosophy in that respect can be acknowledged as impressive, when we take into account the fact that the stance that he adopted is something that even modern professional linguists still struggle to achieve, as epitomized, for instance, by the Sapir-Whorf Hypothesis and its reverberations, during the twentieth century. In the climate in which Valdés operated, his recognition that linguistic idiosyncrasies did not imply superiority or inferiority, or lack of expressivity, showed his independence of thought; he was very much ahead of knowledge of sociolinguistic reality.

Moreover, the translation difficulties that he outlined were no different from those that modern translation theorists and practitioners have discussed and grappled with for generations. Moving on from discussing the issue at a generic level in his mother tongue, Valdés noted that, due to the tricky nature of translation, he was unable to assess works translated from other languages rather than written originally in Castilian. That was the thought of a fairly objective individual, who did not shy away from admitting to his doubts, uncertainties, and weaknesses, in the face of linguistic pluralism as a phenomenon.

In every emerging State in Early Modern Europe, the nurturing of a national language was

an important one to the ruling elite and intellectuals. In the case of Spain, the main efforts on that front are credited to Antonio de Nebrija, particularly his pioneering grammar of Castilian (1492) ("I wanted to lay the foundation stone" were Nebrija's explicit words). Valdés was among those who took over the baton, as he became a key player in the effort to engineer a standardized Castilian for the Spanish Empire. In the context of imperial ambitions and geopolitical realities of the early sixteenth century, the idea that Valdés's *Diálogo* must have been officially commissioned (Crews 2008) is not far-fetched.

In terms of the technicalities of the language standardization process itself, it has been explained that of the four key stages – Selection, Codification, Elaboration of Functions/Intellectualization, and Enforcement/Acceptance (Garvin and Mathiot 1953; Haugen 1966, 1983) – Castilian had already, by the fifteenth century, fully achieved Selection and Enforcement/Acceptance, as well as a degree of elaboration (initiated by King Alfonso X The Learned, in the thirteenth century), more than any emerging Western European State at the time (Anipa 2012b). Thus, Valdés's work on language represented an essential complement to that of Nebrija (captured in the latter's (1989, 1492) oft-quoted words "language and empire always went hand in hand"). Evidence that the stages of selection and enforcement had been accomplished by Valdés's time can be confirmed by his own statement to that effect (Anipa 2014, pp. 51–52). Valdés's aim, therefore, was to underpin Nebrija's prescriptive effort with a *proscriptive* one (the well-known display of hatred by Valdés toward Nebrija and his works, due to regional rivalry, should be understood to be a relatively superficial one). In effect, "[n]o Spanish humanist would work harder to make Nebrija's dream of a Spanish imperial language a reality than Juan de Valdés" (Crews 2008, p. 29). Valdés took the process to the level of "ironing out variability, usually by stigmatizing as "non-standard" the forms found in regional or working-class varieties" (Poplack et al. 2002, p. 89). Ascertaining these modern sociolinguistic facts in his work goes to confirm his close collaboration in the timeless standard language ideology.

Micro-sociolinguistics

One of the qualities that set apart Valdés's work on language is the fact that he efficiently backed up his active engagement in the ideology of standard ("status planning") with examination of concrete linguistic data ("corpus planning"). His corpus, in contrast with those of the rest of his (near-) contemporaries, consisted of a wide range of variable features of Castilian, from graphology, grapho-phonology, morpho-phonology, morphology, morpho-syntax, syntax, lexico-semantics, discourse to stylistics. Modern sociolinguists reduce all these levels of linguistic inquiry to two major dimensions: (a) codification, comprising *graphization*, *grammatication*, and *lexication*, and (b) elaboration, which comprises *terminological modernization*, *stylistic development*, and *internationalization* (Haugen 1983). A display of Valdés's Table of Contents (below), extracted

from the "front matter" of the *Diálogo*, reveals quite an extensive project, covering both of these dimensions (See Fig. 1).

It is not only the range of features he covered in his corpus planning that made his project fascinating; it is the manner in which he filtered them through the three paradigms of descriptivism, prescriptivism, and proscriptivism. The complexity and sophistication of the *Diálogo*, in terms of the corpus that Valdés worked with, only fully emerge when one computes these three paradigms with the variegated levels of linguistic inquiry, then, with the individual linguistic features that he handled. It is no exaggeration when Calvo Pérez (1991, pp. 103–104) observes that the *Diálogo* is like an ambitious linguistic research program, which, even in our day and age, would require the collaboration of many experts from different areas of specialty to be able to carry it out efficiently. He also views the

work as translinguistic and generic in its scope, which can be easily related to any historical state of any given language.

Valdés operated with what has become known as Haugen's (1972) classic formulation of *minimal variation in form* versus *maximal variation in function*, two spheres in which codification and elaboration of functions are viewed in modern Sociolinguistics. Valdés's minimal variation in form is verifiable from how the vast majority of the linguistic features that he discussed had two or more variants. That, to him, was a problem that needed resolving, and the solution lay in proscriptivism and prescriptivism. He "set himself up as a lawgiver [...] not content to record fact; he pronounced judgment [as it] seems to have been accepted as self-evident that of two alternate forms of expression one must be wrong" (Baugh and Cable 1993, p. 272). Consequently, of all the instances of two linguistic variants that Valdés considered, his formula was to declare one of them to be wrong or unacceptable, for one reason or another. He made use of a wide range of expressions in pronouncing his judgments, either explicitly or implicitly.

Turning his attention to lexication, he assessed a list of 106 items, ranging from *abonda* to *zaque* (Anipa 2014, pp. 86–94). His apparent intention to discuss the words in alphabetical order and to provide a replacement lexical item for each of the items was not entirely successful (because 13 of the words did not have replacements, and there was a mix-up, in a few cases, of the intended alphabetical order). However, the effort toward minimal variation in form was enthusiastically displayed.

For his effort toward maximal variation in function, Valdés equally carried out corpus planning. He considered semantic expansion, via double negation, reiteration, overlaid clauses, etc., dwelling on polysemy, in 20 Castilian words (Anipa 2014, pp. 95–100). Since these polysemic words had not been used commonly enough in Castilian, before Valdés's time (he referred to them as "half-used words"), his intention was to prescribe the need to maximize their functions and usage frequency in the language.

In his effort to forge the intellectualization and internationalization (Kaplan and Baldauf Jr. 1997)

of Castilian, Valdés considered linguistic borrowing to go beyond long-standing earlier Greek, Hebrew, Arabic, and Italian sources of the Castilian lexicon. He argued that there was no language in the world that did not benefit from borrowing, both for filling in lexical gaps and purely for enrichment, and declared his readiness to encourage the use of a variety of lexical items and phrases from contemporary Greek, Latin, and Italian, noting how technically impossible it was to draw a neat line between one language and another (Hudson 1996). Once again, the manner in which he discussed the words that he considered for borrowing, and the fact that they had been in the language from the Middle Ages, showed that Valdés meant to encourage the expansion of their semantic fields. Modern sociolinguists agree that a standard language (Valdés's final goal) is more of an ideology than a concrete reality: "It seems appropriate to speak more abstractly of standardization as an ideology, and a standard language as an idea in the mind rather than a reality – a set of abstract norms to which actual usage may conform to a greater or lesser extent" (Milroy and Milroy 1999, p. 19) and that the process inevitably involves having "to make some embarrassing decisions" (Haugen 1966, p. 932). Interestingly, Valdés's language philosophy exhibited all these sociolinguistic realities.

The question of linguistic accommodation (closely related to borrowing) also featured in his work. To explain his point, he drew on a list of 32 pairs of words and phrases, with one element in each pair being Italianate (Anipa 2014, pp. 105–106). It is quite striking that the very concept and term *accommodating* that he used to describe the phenomenon, in the early sixteenth century, is the same one used by modern sociolinguists in our day and age. Once again, there is a degree of mix-up of three of the items on this list, but the intention and effort invested are very clear to see. He also treated discourse markers, stylistics, and etymology along the same lines (Anipa 2014, pp. 106–126), separating polysemy (which he prescribed) from ambiguity (which he condemned and proscribed).

The idea of language as a living thing that exists independently of its users is associated

historically with the nineteenth-century Neogrammarians. From the twentieth century, however, sociolinguists have had to work hard to argue vehemently against, and deconstruct, that conceptualization of language as fallacious. J. Milroy (1992, p. 23), for example, has stated that “it is not true that language is a living thing [...] it is a vehicle for communication *between* living things, namely human being.” It is fascinating that, nearly half a millennium earlier, Valdés made the same argument: that a language could not change without the human beings who used it. To the hypothetical notion (from one of the interlocutors of his dialogue) that a language might change naturally, he crisply stated that it was ridiculous to think so, before proceeding to assert that it was humans who, gradually and subconsciously, over time, brought about linguistic change, through usage (Anipa 2014, p. 81) – as if he had traveled in a time machine and were addressing the Neogrammarians and their modern heirs directly.

Renaissance linguistic thinkers were, invariably, confronted with an intriguing paradox. On the one hand, there was the need to distance nonclassical languages from Latin, in order to assert the “new” languages’ potential for self-sufficiency; on the other hand, there was the need to link the same languages, as closely as possible, to Latin, in order to endow them with the much-needed prestige that Latin had enjoyed for centuries. Valdés did not shy away from that paradox and the balancing act that it entailed. In an era of significant resentment, among European scholars, to efforts by Italians to claim cultural supremacy (for having directly inherited the treasures of classical scholarship of ancient Rome), Valdés can be commended for having handled that thorny issue in a most diplomatic manner, as he compared the closeness of Castilian and Tuscan to Latin (see the last chapter heading of his Table of Contents, above). He largely argued that a careful and objective etymological analysis would reveal that there was hardly any difference in closeness to Latin between Castilian and Tuscan, except for the degree of modification to which they subjected words of Latin origin; and he ended the tricky

discussion tactically by leaving the issue open for further discussion (Anipa 2014, p. 126).

Literary Criticism

As indicated earlier, the long-standing interpretation of the *Diálogo* as literature or literary criticism has changed rapidly. But Valdés did not neglect literature altogether. He openly acknowledged the importance of a body of high-status literature as one of the pillars of a standard language ideology and devoted about 14 % of the *Diálogo* to commenting on a number of literary works, written between the Middle Ages and the sixteenth century.

The relationship between literature and linguistics has been a subject of discussion over the decades, and there is a broad consensus among sociolinguists that literature is a legitimate data source on which sociolinguistic behavior can be observed, because even the language of fiction is somebody’s creation (Anipa 2012a, p. 180). The purely literary aspect of Valdés’s discussion can only be gleaned from the *Diálogo*, and it dealt with the need for realism as a fundamental precept in fiction writing: “los q̄ eſcriuen mentiras las deuen eſcreuir de fuerte, q̄ ſe alleguen quanto fuere poſſible ala verdad, de tal manera q̄ puedan vēdē ſus mentiras por verdades” (Anipa 2014, p. 119). Beyond that, Valdés focused on word choice, syntax, style, and appropriateness of diction. On this issue, Romaine (1982, p. 21) has pointed out that “[t]he linguist will be interested in the language as language in the first instance, while the literary critic is interested in the language as literature.” It is most interesting that Valdés made an almost identical statement, in the literature part of his *Diálogo*, stating that his main interest in discussing literature was language as language: “aqui no hablamos ſino de lo ē perteneçe a la lengua” (Anipa 2014, p. 114). Bearing in mind the rather late recognition of Valdés’s *Diálogo* as a unique work on language, it may be fair to note that there remains more about its multifaceted dimensions yet to be unraveled by future generations of Renaissance scholars.

Writing on Religion (Terence O'Reilly)

The religious writings of Juan de Valdés may be divided into two groups. First, there are his works on certain books of the Bible. His university education in the 1520s, which included Greek and an introduction to Hebrew, equipped him to study the Scriptures, a task to which he devoted himself throughout the 1530s. He was the first person of his time to translate the Psalter from Hebrew into Spanish (Ricart 1964), and he wrote a commentary on the Psalms, only part of which has survived (Psalms 1–41). He also translated and commented on the Gospel of St. Matthew. These works remained in manuscript until modern times. Two further translations with commentaries, both on the letters of St. Paul, were published in the sixteenth century, one on the *Epistle to the Romans* (c.1556), the other on the *First Epistle to the Corinthians* (1557). These biblical writings were edited piecemeal in the nineteenth century, but scholarly studies of them have been few, and we do not yet possess a critical edition of them all. The second group consists of Valdés's writings on the nature and development of the Christian life (Reinhardt 1990–99). These have been edited in one volume by Ángel Alcalá (1997). Most of them are short treatises, but three are works of substance in which Valdés gave detailed expression to his thought: the *Diálogo de doctrina cristiana*, the *Alfabeto cristiano*, and *Ciento diez divinas consideraciones*.

Diálogo de doctrina cristiana

The *Diálogo de doctrina cristiana* was printed by Miguel de Eguía in 1529 in the university town of Alcalá de Henares. Prohibited a short time later by the Spanish Inquisition, it disappeared from view until the early 1920s, when a copy in the Biblioteca Nacional in Lisbon was discovered by Marcel Bataillon, who published it in facsimile in 1925 (Bataillon 1925). The book is dedicated by its anonymous author to the Marquis of Escalona, Diego López Pacheco, in whose household Valdés had spent a formative period of his youth, and it is cast in the form of a colloquy between three

speakers. Antronio is an unlettered parish priest who wishes to teach children the rudiments of the Christian faith. He is unsure, however, how to carry out his task. Eusebio is a member of a religious order who has met and befriended Antronio and wishes to help him obtain the Christian formation he needs. With this in mind, he introduces him to Pedro de Alba, the Archbishop of Granada, who is a devout and learned man. Alba then proceeds, in the course of a day, to instruct his two hearers on the main points of Christian faith and practice. His subject matter is traditional. He considers in turn the Creed, the Ten Commandments, the Sermon on the Mount, the Deadly Sins, the gifts of the Holy Spirit, the Cardinal and Theological virtues, and the Our Father. Such topics formed the substance of the catechetical literature that became popular in the late medieval Church after the Lateran Council of 1215. The treatment of them in the *Diálogo*, however, is influenced by two writers who were sharply critical of late medieval piety: Erasmus and Luther.

When the *Diálogo* appeared in print, Alcalá de Henares was a center of enthusiasm for the writings of Erasmus, especially those on prayer and the Christian life. His *Enchiridion Militis Christiani* had been printed by Miguel de Eguía 3 years earlier in a lively Spanish translation that quickly became a best seller (Bataillon 1991). A number of themes in the *Enchiridion* reappear in the *Diálogo*. One of them is that the life of perfection described in the Gospel is the fruit of baptism. It is, therefore, open to all Christians, and not only to clergy and religious, a point made often by Erasmus and summed up in the *Enchiridion* by the phrase *monachatus non est pietas* (piety is not the preserve of the monastic state). Another is biting criticism of attachment to the outward forms of religious practice. True Christianity, it is affirmed, is interior and spiritual and centered on Christ. A dramatic contrast between mere externals and a devout interiority runs through the work. The renewal of Christendom, it is indicated, will be brought about by conversion to Christ and by the study and practice of his teachings in the New Testament. These themes come together forcibly in the opening section on the Creed, which is a lightly adapted version of

one of Erasmus's *Colloquies*, the *Inquisitio De Fide*, first published in 1524. Elsewhere the Archbishop urges his listeners to read Erasmus, whom he describes as "truly a theologian," and the translation of the Sermon on the Mount with which the work concludes is based on the Greek text and the new Latin version that Erasmus had published in 1516.

Erasmus, despite his importance, was not the only influence on the movement of religious renewal in Alcalá. Its adherents drew inspiration also from other currents, some of them hard to reconcile with his thought. These included various forms of later medieval spirituality and the teachings of the Spanish illuminists or *alumbrados* (Asensio 1952). Protestant works, though banned, circulated clandestinely in certain quarters, including the circle around the humanist Juan de Vergara to which Valdés belonged. The *Diálogo* shows that its author was acquainted with them and in particular with the writings of Luther, from which numerous passages, mostly brief, are drawn (Gilly 1983). In these passages, whose source is concealed, a recurrent theme is the damage inflicted by the Fall on the capacity of human beings to will or perform what is good and their utter dependence as a result on divine grace, granted through trusting faith in Jesus Christ. Luther's dark perception of human nature, which he found confirmed in the writings of St. Augustine, stood in marked contrast to the outlook of Erasmus, who was influenced by the more optimistic theologies of Origen and the Florentine Neoplatonists. The divergent views of the two reformers led to the formal break between them that took place in 1524. The *Diálogo* shows that in this matter, Valdés sided with Luther. He was probably disposed to do so by his experience as a young man of hearing the sermons of the *alumbrado* Pedro Ruiz de Alcaraz, in which the moral weakness of the human will was underlined (Nieto 1970, 1979). An Augustinian view of human sinfulness also informs much of the devotional literature popular in Spain when Valdés was growing up, including two works recommended in the *Diálogo*: the *Life of Christ* by Ludolph the Carthusian and the *Imitation of Christ* by Thomas à Kempis.

The influence on the *Diálogo* of both Erasmus and Luther means that it cannot accurately be described as either Erasmian or Lutheran (Gilly 2005). Valdés borrows from both writers in order to articulate a position that is distinctively his own. He implies that justification by faith is an essential element in religious renewal, but he does not follow Luther in rejecting the structures of the late medieval Church. Instead, he envisages a revival that will take place within them, without disturbing the unity they underpin. The commandments of the Church are described as human ordinances that require a formal observance, unlike the divine precepts of the Gospel that engage the conscience intimately. They are to be observed, with discretion, nonetheless. The speakers in the *Diálogo*, moreover, represent the three clerical orders of priests, religious, and bishops, each of which is accorded a role in the task of reform. This task will begin in the parishes with the instruction of children and adults by priests and religious who are both educated and devout, and it will be led by enlightened prelates of whom the Archbishop is a model. Pedro de Alba, who died a year before the *Diálogo* appeared, was remembered for the learning and zeal with which he had discharged his pastoral duties, qualities exemplified also by Hernando de Talavera, his predecessor in Granada (Pastore 2004, 2010).

Alfabeto cristiano

The *Alfabeto cristiano* was composed in Naples, probably in the spring of 1536. In the early 1540s it was rendered into Italian by Marcantonio Magno, and his translation, which survives in a manuscript of the Vatican Library (Firpo 1994), was printed in Venice, with minor amendments, in 1545. The Spanish text on which it was based has not survived. Like the *Diálogo de doctrina cristiana*, the *Alfabeto* offers an introduction to the Christian life. Its focus, however, is not the teachings of the catechism but the process of inner conversion that the call of the Gospel entails, a process that leads, it shows, to perfect love in union with Christ. The origin of the work is

explained at the start: it records in dialogue form a conversation that took place one day between Valdés and a young aristocrat, Giulia Gonzaga. They met as she was returning from a sermon by the Capuchin friar Bernardino Ochino, whose words had disturbed her deeply for reasons she could not understand. Valdés, after listening, is able to tell her why. Her problems are those of human nature in its fallen state, in which self-interest reigns supreme. The remedy is to move away from preoccupation with herself and to turn with faith toward God, a change of heart that he describes in the language of St. Paul as taking off the Old Adam and putting on Christ, the New Man fashioned in God's image. To help her he prescribes certain spiritual exercises. Each day she is to meditate on two subjects: first, her own moral weakness, which will teach her knowledge of self, and second the goodness of God, made visible especially in *il beneficio della passione di Cristo* (the gift of the Passion of Christ). His hope is that she will pass from a life ruled by fear to one in which her only motive is love: "I want you to walk along this path as a lady, not a servant, as a free person, not a slave, with love, not fear" (p. 330). Giulia is willing to comply, but she confesses to a further doubt that holds her back: the teaching of Ochino that good works performed without pure love have no merit in the eyes of God. This makes her wonder how she can be saved, for she knows that her own works are inspired by the selfish motives of fear of Hell and desire for heavenly glory. Valdés explains in reply that God draws us to himself in stages, beginning with fear of punishment and moving on to gratitude for his gifts and longing for the joys of Paradise. Eventually, we come to know that he is truly good and to love him with a passion that is disinterested. Then we serve him, "not as slaves but as freemen, not as mercenaries but as sons; and this is what Christian freedom means" (p. 361).

Despite its distinctive character, the *Alfabeto* has much in common with the *Diálogo de doctrina Cristiana*, whose themes it develops in three ways. First, it underlines that the life of perfection is open to all. The notion that spiritual progress involves passing from the fear of slaves, through the self-interest of mercenaries, and on to

the love of sons was adumbrated by the Fathers of the Church and developed in the monastic writings of the Middle Ages. The *Alfabeto* reveals how familiar Valdés was with such writings, a familiarity confirmed by his reply when Giulia asks him what she should read. The works he recommends, in addition to the Bible, are all monastic in provenance: the treatises of John Cassian, the lives of the early hermits by St. Jerome, and the *Imitation of Christ*. He adds that he himself has found them helpful. However, the context of the *Alfabeto* is not monastic at all. Giulia is a noblewoman involved in activities appropriate to her class, and Valdés does not counsel her as a priest but as a layman. The setting of their dialogue, moreover, is not a monastic cloister, but urban, feminine, and domestic. This becomes apparent when they discuss the times and places suitable for meditation. Valdés pictures Giulia in her home and in her bedroom, meditating at whatever time suits her best. He recommends the highest Christian ideals, but he emphasizes in doing so that they may be lived in the heart of society. When Giulia asks him to tell her how to lead a devout life that is private and hidden from the gaze of others, he responds by showing her that to be perfect one does not have to abandon the world and take religious vows. His words astonish her, for she had always supposed that the state of perfection was reserved for nuns and friars, but he insists that she is mistaken. All Christians, clerical, religious, and lay, will be judged by the same standard: "those who are friars and those who are not will have as much Christian perfection as they have faith and love of God, and not a cent more" (p. 292).

Second, the *Alfabeto* accords a central place in the Christian life to St. Paul's teaching on justification. In this respect, it reflects a general change in spiritual writings of the time. The initial wave of Erasmianism in Castile lasted from 1516, when the first translation of Erasmus appeared, to the early 1530s, when the Inquisition began to take action against individuals with strong Erasmian and reformist views. In the decades that followed, the process of repression continued, reaching a climax in the late 1550s. During the same period (c. 1530–1559), the concerns of spiritual writing

moved away from the topics that the *Enchiridion* had made popular. In the works of contemporaries of Valdés, such as Juan de Avila, Luis de Granada, and Bartolomé de Carranza, attention came to be focused not only on the conflict between letter and spirit that the *Enchiridion* had analyzed perceptively, but on justification, trusting faith in God, and gratitude for the benefits of Christ's Passion. Signs of this development are apparent in the *Diálogo de doctrina cristiana*, but they are more prominent in the *Alfabeto*, where Valdés affirms repeatedly that a person is made just by faith: "to be a Christian is to be just, and no one can be just except by faith, for the just man lives by faith" (p. 412). The object of faith is the Passion of Jesus, which reversed the Fall and made possible the forgiveness of sins. In the *Diálogo de doctrina cristiana*, there are few references to the Cross and implied criticism of popular devotions to the Passion that involved reconstructing imaginatively the events of Christ's death. Both Erasmus, in the *Enchiridion*, and the *alumbrados* of Castile were critical of such devotions too. In the *Alfabeto*, by contrast, Valdés advises Giulia to dwell continually on *Il beneficio di Cristo*, with confident faith that Jesus died to set her free. The contemplation of Christ crucified enables one to master temptation, it replaces fear with selfless love, and it helps the Christian to grow: "we cannot know, believe or love God except by the contemplation of the crucified Christ" (p. 428). Valdés shows how this principle may be applied in Giulia's everyday life. He also indicates its implications for the Church as a whole. The recovery of justifying faith among Christians, and their release from fear and self-interest, will destroy the attachment to religious externals in which many have sought salvation. It is for him the key to Church renewal.

Third, the *Alfabeto* works out in more detail the assumption in the *Diálogo de doctrina cristiana* that an interior life animated by justifying faith is compatible with fidelity to the Church. Valdés encourages Giulia to ponder often, and in the light of her experience, the articles of the Creed that the Church offers for her instruction. Then she will not just recite the words but will grasp inwardly the teachings they proclaim. This is true of the articles on the Church itself, which

describe it as one, holy, catholic, and as the communion of saints. She will see that Christ's Church is universal; that it shares in the holiness that is his; that its members include the bad and the good; and that to those who are moved by faith, hope, and love, it offers a union that is spiritual. It is, moreover, protected by Christ: "He promised that faith would not fail in the Christian Church, and it has not failed" (p. 436).

This positive conception of the Church, which coexists with the conviction that it needs reform, underlies the advice Giulia receives about how to perform her religious duties. She is to observe the commandments of the Church, without forgetting the spiritual purpose that underlies them, and she is to approach conscientiously the sacraments of penance and communion. When she goes to confession, she should do so with trusting faith in Christ's promise to give his priests the power to forgive sins, and once the minister has pronounced the words of absolution, she is to believe firmly that she has been pardoned, not because she has confessed, for "that would be to attribute to yourself what is not yours" (p. 465), but because of her faith, hope, and love, centered on Christ. In the same spirit, she should attend mass regularly, not only on feasts but every day, unless prevented by a work of charity. There she should attend carefully to the readings and liturgical prayers, and she should listen to the sermon as if it were Christ's own words. If the priest talks about worldly matters to the neglect of spiritual ones, she may choose to leave, as Valdés often does in exasperation, but if she has the patience to stay, she should beg the Lord to send worthy preachers to the Church. Above all, she is to adore Christ in the Eucharist, where his body and blood are truly present. This will inspire her with a fervent longing to be incorporated by faith and love into the Passion, for the Eucharist recalls the death that established a new covenant, a covenant that makes it possible to believe that "we are justified by the blood of Jesus Christ" (p. 467).

Ciento diez divinas consideraciones

Justification is a recurrent theme in all the religious writings that Valdés penned between 1535

and 1541. They include *Ciento diez divinas consideraciones*, which was printed in Basle in 1550 in an Italian translation. It consists of a series of meditations on the Christian life, from its beginnings in justifying faith to its end in perfect love of God. Valdés composed them week by week for the gathering of friends that took place in his home in Naples every Sunday. Each meeting began with a reading out loud of the meditation he had prepared in advance, and it ended with a general discussion in which he answered questions. He sometimes wrote up afterwards the questions asked and the answers given, and a number of these records found their way as well into the finished work (Crews 2008). This has come down to us in several redactions. There is the Italian translation, probably by Mario Galeota, which was printed in the *editio princeps* of 1550. There are also two contemporary versions in Spanish, one conserved in the Stadt Bibliotek in Hamburg, the other in the Biblioteca Vaticana, and a partial Spanish version of 39 meditations, preserved in a manuscript of the National Library of Vienna. The relationship between these versions and the original Spanish text of Valdés is not clear, and because the redactions differ among themselves in several ways, including the number and ordering of the contents, it is not possible to establish on their basis a definitive text. The purpose of the work is nonetheless clear. Aware of moves in the late 1530s to heal the schism between the Christian churches, Valdés wrote the *Consideraciones* in the hope that his approach to the divisive issue of justification, and in particular to the relation between faith and good works, would win the approval of both sides (Crews 2008). The book circulated widely within Italy in manuscript, and along with his other late writings, it came to the attention of those involved in bringing Catholics and Protestants together. They included two cardinals, Gasparo Contarini and Reginald Pole, who shared the goal of restoring unity by a double-edged strategy: by convincing Catholic theologians and churchmen that Luther's understanding of justification was fundamentally orthodox and by reconciling the Reformers to a Catholic view of the sacraments and the Church (Fenlon 1972). Matters came to a head in the spring and early summer of 1541 at the Colloquy of Regensburg,

when theologians from both sides assembled to discuss their differences. In the matter of justification, they found common ground, and they came to a formal agreement that reflected, in its essentials, the approach that Valdés had pioneered. The talks broke down, however, when they turned their attention to the sacraments and the structures of the Church, on which their views diverged. The collapse of the Colloquy was followed, in the August of that year, by the death of Valdés.

The *Ciento diez divinas consideraciones* tackles the matter of justification by examining three stages in the life of the person who comes to believe in Christ. First, there is the natural state of fallen humanity, which Valdés portrays in dark, Augustinian terms as the loss of the divine image in which human nature was made. The person subject to it is ruled by self-interest and a corresponding abhorrence of God. Second, there is the act of faith by which a person accepts the reconciliation with God made available by the death of Jesus, who took on himself the punishment of humanity's sins. This is the *beneficio di Cristo*, the gift bestowed in and by Christ. Third, there is the process of regeneration by which the divine image lost at the Fall is restored. The faith of the Christian bears fruit increasingly in hope and love, a love that finds expression in good works, and he comes to serve God as a loving son rather than as a fearful slave. A feature of this third stage is the experience of being guided by the Holy Spirit in all things, including the interpretation of Scripture, a theme that Valdés may have drawn from the teachings of those among the Spanish *alumbrados* who practiced *dexamiento*, the surrender of one's will to the action of God in the soul (Hamilton 2010; Firpo 1990).

In his discussion of these three stages, Valdés speaks always in his own voice. Though familiar with the literature on justification composed by Catholics and Protestants of his time, he does not refer to it directly, and despite his learned interest in the Fathers of the Church, he does not allude to their writings, which both sides invoked. Nor does he use the language of scholastic theology that both sides readily employed, though he is aware of its importance in the debate. He seeks instead to address the issues at stake in a way that is not

confrontational by basing his own approach on two sources whose authority was accepted by all: the experience of life in Christ that baptized believers share and the testimony of Scripture, especially the letters of St. Paul. His focus is the interior life of the individual seen as a member of the Church, which is described as the mystical body of Christ. He does not move beyond justification to consider further contentious matters, such as the sacraments or the structures of the Church. A concern to avoid dissension, and to preserve Church unity as far as possible, is evident in other late writings, including the commentary on First Corinthians, composed circa 1539. There he inveighs against individuals who allow their theological opinions to disrupt the harmony of the body, and in the teachings of St. Paul, he finds guidelines for reconciling those who have been seduced by false prophets and have left, or are about to leave, the Church. Preserving ecclesial unity is a duty incumbent on all (Crews 2008).

Impact and Legacy

Language: The fact that Valdés's work on language was not published for two centuries might raise the question as to its possible dissemination and impact during the Renaissance. But there is a prerequisite to an objective judgment of the issue: proper understanding of the work. "The *Diálogo de la lengua* of Juan de Valdés is commonly misunderstood" (Navarrete 2004, p. 3). It is a dense and multilayered work, best understood through the prism of modern sociolinguistics. This is because "the primary focus of the *Diálogo* is sociolinguistic" (Ibid., 2004, p. 11). Calvo Pérez (1991, p. 104) rightly observes that Valdés's work on language was several centuries ahead of that of any other linguistic thinker of his time.

Depending on circumstances, lack of publication may not necessarily be evidence for lack of dissemination or impact. In the case of the *Diálogo*, a couple of factors were crucial. First, we know that a manuscript tradition, alongside the print tradition, remained vibrant among intellectuals, during the Renaissance (Bouza Alvarez 2004). A second factor is the subject matter of the *Diálogo*. A work on language ideology and

standardization need not have been read necessarily by a large number of the populace, in order to have fulfilled its intended aims. This is because language policy and language planning are mostly a "top-down" operation (Cooper 1989; Kaplan and Baldauf Jr. 1997). That being the case, some impact of the work among the elite would have been sufficient for its purpose. This understanding is no mere conjecture on my part, because Valdés himself stated explicitly in the *Diálogo* the class of people that the work was meant to serve. Written in Naples, the *Diálogo* did not take long to reach Spain, where it was read, passed round, and copied among a group of humanists (known to Renaissance scholars as the Toledo Circle), who were closely connected with the ruling elite. Not only did they read the work keenly, but they also took appropriate steps to shield it from the potential perils of the Inquisition (Anipa 2011). Even after the *Diálogo* found its way into print, there was still some interest in copying the manuscript; such was the case of Usoz y Río, who copied it (MS 7265) and went on a quest for another copy that he had read about, prior to publishing his edition, in 1860. Through Usoz y Río, interest in the *Diálogo* reemerged in nineteenth-century England, where it was well received, read (at least, among the Quakers), and even translated into English, in 1856–1857. In twentieth-century Spain, the work became required reading in graduate courses in Spanish, which contributed to the *Diálogo* being "the best-known Valdesian work" (Crews 2008, p. 102), although it has attracted less than 10 % of all writings on Valdés (Calvo Pérez 1991, p. 54). A bilingual Spanish-French edition was published as recently as 2008; and it might not take long before an English edition appears. All in all, the *Diálogo* has been the number one source of authoritative reference (multiple times more than Nebrija's grammar) for modern Hispanic historical linguists working on Castilian, from the sixteenth century onwards.

Religion: In the course of 1541 the disciples of Valdés in Naples dispersed. Some of them crossed the Alps after the Colloquy of Regensburg and joined the Protestant Reform. Most of the others moved north to Viterbo and entered the circle of Reginald Pole (Firpo 1990, 2013), who after the death of Contarini in August 1542 became the

leading figure in the movement to reconcile the Churches (Edwards 2014). In the run-up to the Council of Trent, which met in 1545, the Viterbo group disseminated the teachings of Valdés in manuscript, translation, and print, and one of their number, Marcantonio Flaminio, coauthored *Il beneficio di Cristo* (1543), a treatise that drew significantly on Valdés's ideas and expressed them in forthright terms (Caponetto 2009). When the Council assembled in 1547 to discuss justification, the writings of Valdés were therefore known not only to the papal legates, who included Reginald Pole, but to many of the bishops, a large proportion of whom were Italian. In the event, the debate in the Council was shaped by the scholastic theologians present, especially the Thomists and the Scotists, and the prelates who favored a theological discourse that would be acceptable across the theological divide found themselves in a minority (Fenlon 1972). The final decree laid emphasis on a number of themes that Valdés had developed earlier, including the dependence of justification on the merits of Christ, the fruitfulness of faith in hope and love, and the union of baptized Christians in Christ's mystical body. It was careful, however, to avoid terms and concepts that the Reformers had made their own, including a distinction between imputed justice and regeneration that Valdés had been happy to use. In the Canons with which it concluded, moreover, the decree spurned explicitly the main tenets of Luther's teachings as the Council Fathers understood them (McGrath 1986; O'Malley 2013), and from that point onwards, pressure grew on Catholic writers to build into their theological language the affirmations and anathemas that the Canons enshrined. In such circumstances, the writings of Valdés came to be seen in retrospect as heterodox, and in both Italy and Spain, they were included in the Indices of Prohibited Books by which the decrees of Trent were enforced. In the twentieth century, however, developments in Catholic theology, and agreements about justification between Rome and the Protestant churches, made it possible to view Valdés in a different light and to argue that his teachings, in their pre-Tridentine context, did not mark a break with Catholic orthodoxy (Domingo de Santa Teresa 1957; Crews 2008).

In the aftermath of Trent, the religious writings of Valdés were preserved by his followers who had joined the Reform, and through them, his teachings became widely known among Protestants (Ricart 1958). Their reception in such circles was mixed. Some were severely critical, including John Calvin and Theodore Beza, but others found in them a sympathetic statement of their beliefs. In England in the seventeenth century, for instance, the *Ciento diez divinas consideraciones* were translated from the Italian by Nicholas Ferrar, the founder of the Anglican community in Little Gidding, and the work was praised, despite some reservations, by the poet and pastor George Herbert. Among Lutherans, Anabaptists, Quakers, and even Unitarians, Valdés found interested readers, and in the nineteenth century, his legacy was restored by Protestant scholars who traced and edited the greater part of his works. Their patient labors drew attention to his importance, and they laid the foundation of the modern studies of his thought that began in the 1920s with the work of Marcel Bataillon. He argued that all the themes of Valdés's late writings were present implicitly in his first work, the *Diálogo de doctrina cristiana*, which he described as "a moderately Erasmian catechism." Valdés's contact with the *alumbrados*, he held, would have disposed him to read Erasmus with enthusiasm. The moral pessimism of the text, and its allusions to justification by faith, did not indicate, in his view, that Valdés at the time had read Luther. He could well have arrived at such convictions himself, for example, through reading St. Paul (Bataillon 1925). Bataillon's interpretation held sway until 1970, when it was contested by José Nieto, who argued that the Erasmian elements in the *Diálogo de doctrina cristiana* were designed to mask a Protestant theology of justification and the Church. Valdés, he held, did not draw this theology from Protestant writers directly, but from the *alumbrado* teacher Pedro Ruiz de Alcaraz, who had reached, independently, the same conclusions as Luther (Nieto 1970, 1979). Nieto's thesis received a mixed response. It was accepted by Bataillon, who confessed himself persuaded that Valdés had used Erasmus to conceal Protestant beliefs, and it was carried further by Massimo Firpo, who applied it to the activity of Valdés in

Italy during the 1530s. He detected in the late writings of Valdés a strong *alumbrado* influence, especially in his teachings on guidance by the Holy Spirit, and he argued that Valdés was a Nicodemite who held that outward conformity with Catholic practice was compatible with inner dissent from certain Catholic doctrines (Firpo 1990). More recent research, however, has called into question the premises on which Nieto's argument was based. Studies of the *alumbrados* have not confirmed that the teachings of Alcaraz anticipated those of Luther (Hamilton 2010), and an alternative explanation of Protestant elements in the *Diálogo de doctrina cristiana* has been provided by Carlos Gilly, who has shown that when composing it, Valdés was familiar already with the writings of Luther, Johannes Oecolampadius, and perhaps Philipp Melanchthon too (Gilly 1983). The notion that Valdés used Erasmus as a rhetorical mask for heresy has been discounted by a number of scholars (Pastore 2004, 2010; Gilly 2005; Crews 2008) who have concluded, on various grounds, that the theology of Valdés was indebted to both Erasmus and Luther without being reducible to the thought of either, and the related notion that the ecclesiology of Valdés was Protestant has been undermined by evidence that Valdés believed it possible to combine his theological convictions with faithful membership of the Catholic Church (Crews 2008; Firpo 2013). In spite of these advances, historians continue to disagree about the precise sources, nature, and impact of Valdés's religious ideas, and further research into the matter has been hindered by the lack of a critical edition of his surviving works. The manuscripts and printed texts necessary for such an edition have been identified (Kinder 1988; Firpo 1994), but the task of producing it has yet to be carried out.

Valier, Agostino

Born: Venice, 7 April 1531

Died: Rome, 23 May 1606

Francesco Luciola

University College Dublin, Dublin, Ireland

Abstract

The Venetian Agostino Valier (Venice, 7 April 1531 – Rome, 23 May 1606), Cardinal and Bishop of Verona, prefect of the Congregation of the Index, and member of the Holy Office, was one of the leading figures of the Italian Church in the years of the Council of Trent. As a professor of philosophy in the so-called

Scuola di Rialto, he achieved a form of eclecticism founded on the interaction between philosophy and humanism. He wrote over 200 works, both in Latin and in the vernacular, including letters, treatises, booklets, orations, dreams, eulogies, biographies, reports, and commentaries, which demonstrate his interest in different literary genres and topics, such as philosophical exegesis, conduct literature, historiography, and rhetoric. His first texts, mainly addressed to members of the Venetian aristocracy, offer a series of practical norms to prepare them for the political or civil roles with which they would be invested. Once he became Bishop of Verona, he tried to reconcile his previous philosophical and pedagogical interests with his new public role, following the example of other humanists, such as Cardinal Gian Matteo Giberti. Therefore, he pursued social and religious reforms, combining the humanist system proposed by Giberti with the models for pastoral care discussed and promulgated during the Council of Trent, and particularly, under the influence of Carlo Borromeo.

Biography

Agostino Valier was born in Venice, on 7 April 1531; his father, Bertuccio, was a patrician, as was his mother, Lucia, sister of the future Cardinal Bernardo Navagero. Valier was educated in Venice and then went to Padua to study the Greek language. During these years, he wrote a series of orations and letters addressed to illustrious members of both the Paduan university and the Venetian aristocracy (e.g., Lazzaro Bonamico, Marcantonio Genua, Pietro Landi, Marcantonio Trevisan). In 1555 he visited Rome with his uncle Bernardo Navagero on the occasion of the election of Pope Paul IV. In the same year, he also became *Minoris Ordinis Praeconsultor* (a rank appointed by the Venetian Senate). In 1558 he obtained the chair of philosophy in the so-called Scuola di Rialto: on that occasion he delivered the *Praefationes nonnullae habitae in gymnasio Veneto cum moralem philosophiam Venetis adolescentibus explicaret, in quibus sacram*

theologiam cum philosophiae studio coniungendum esse ostendit. The texts which Valier wrote in these years show an original and personal approach to philosophical matters: departing from the dogmatic interpretation of Aristotelianism (characterizing works such as his *De tempore* or *De loco*), Valier aimed to achieve a form of eclecticism founded on the interaction between philosophy and humanism. One work embodying his perspective is the *De recta philosophandi ratione*: this text is dedicated to defining the need for a balance between conflicting trends (philosophy and religion, but also Aristotelianism and Platonism), rather than establishing a specific method, since “to him, the proper use of philosophical knowledge was more important than philosophical method or the choice of any particular philosophical system” (Pullapilly 1992, p. 331). The *De recta philosophandi ratione* is first printed in 1577 in a volume collecting also other *praefationes*, that is, philosophical lectures on different topics (e.g., *In libros de moribus Aristotelis*, *In Cebetis tabulam*, *In libellum Porphyrii de quinque vocibus*, *In libros del coelo*). The 1577 edition also contains four *opuscula*, addressed to members of the Venetian aristocracy, which offer a series of practical norms to prepare them for the political or civil roles with which they would be invested. These works are *Qua ratione versandum sit in Aristotele*, *Qui mores in cive Veneto requirantur*, *Quibus in artibus adolescens Venetus debeat excellere*, and *De commentariis conficiendis memoriae causa*. That means that the literary production of the 1550s is not entirely devoted to philosophical topics; rather, it is also characterized by works on conduct, “dominated by a theme that was to recur with little change in the writing of Valier’s episcopal period: condemnation of ambition and exaltation of contempt for honours” (Logan 1996, p. 222). In these works Valier stresses the importance of the *studia humanitatis* as a link between intellectual and public life and attributes to men of letters the role of leading figures within their own societies. In 1560, therefore, Agostino Valier located his principal interests in teaching and civil engagement, but also in the fulfillment of his personal

view of a type of humanism in which philosophy, letters, and religion converge to create an ethical system.

This perspective underwent a change in 1561, when Bernardo Navagero, Valier's uncle, was elected cardinal. Valier, who had already addressed to the uncle his lost *De fugiendis honoribus* (another conduct text in dialogue form), became Navagero's secretary and left Venice for Rome. At the Roman court, Valier met Carlo Borromeo, who invited him to take part in the academy called *Notti Vaticane* (this experience would provide the subject matter for the *Convivium Noctium Vaticanarum* by Valier). A few years later, he again accompanied his uncle, now Bishop of Verona, to the Council of Trent; but on the way back, Navagero fell ill and, before dying (31 May 1565), asked and obtained that his nephew should replace him as leader of the diocese of Verona. Therefore, Valier was elected Bishop of Verona on 28 May 1565. Once in his diocese (17 June 1565), Valier tried to reconcile his previous philosophical and pedagogical interests with his new public role, following the example of other humanists, starting from one of his predecessors in the diocese, Cardinal Gian Matteo Giberti. Valier continued and pursued the social and religious reforms introduced by Giberti in sixteenth-century Verona, which concerned various aspects of life (Christian practice, education, marriage, family). However, Valier tried to combine the humanist system proposed by Giberti with the models for pastoral care discussed and promulgated during the Council of Trent and particularly under the influence of Carlo Borromeo (see Tacchella 1972). Following the example of Borromeo in Milan, and with the support of new religious orders (such as the Theatines and the Jesuits), Valier promoted a series of initiatives, such as the founding of a diocesan seminary, the reform of local monasteries and religious institutions, the organization of Catholic associations and confraternities, and the diffusion of schools of Christian doctrine. All these projects were related to specific editorial plans, because Valier attributed to the printing press an important role in the diffusion of the ideals of the Reformed Church. This is why the works written by Valier

(or published with his support) soon after his election – catechisms, texts for clerics, rules for schools of Christian doctrine and for confraternities – are characterized by a strong pragmatism.

Alongside this prescriptive production, Valier also wrote some works which are at once descriptive and prescriptive, concerned with both religious and social education, and intended to define the behavior of a good Christian. These works, deeply influenced by his friendship with Carlo Borromeo, who was overseeing a similar reform in the diocese of Milan, can be divided into two groups, according to the different readerships (religious or secular) they were meant for. One group comprises treatises and collections of practical examples for priests, monks, and clerics: these works aim to regulate fields such as Christian oratory (*De rhetorica ecclesiastica ad clericos*, 1574), the life of a bishop (*Episcopus, seu de optima Episcopi forma*, 1575) and of a cardinal (*Cardinalis, sive de optima Cardinalis forma*, 1575), but also the behavior of nuns (*Ricordi [...] lasciati alle monache nella sua visitazione fatta l'anno del santissimo Giubileo 1575*, 1575). The second group of works may be connected, much more directly, to the so-called social disciplining, that is, the attempt to regulate people's private lives (see Oestreich 1969; Prodi 1994). Among these works we can mention the *Ricordi al popolo della città e diocesi di Verona* (1579), and especially the three books for women published in 1575 under the single title of *Instituzione d'ogni stato lodevole delle donne cristiane*: that is, *Del modo di vivere delle vergini che si chiamano demesse*, for unmarried women; *Della vera e perfetta viduità*, for widows; *Istruzione delle donne maritate*, for married women (Valier 2015). These manuals of behavior demonstrate extensive continuity with the prescriptive texts for clerics, but also with the works addressed to the Venetian aristocracy at the beginning of Valier's literary career. Although now influenced by Tridentine precepts, the texts for secular as well as religious men and women by Bishop Valier continue the project of a philosophical humanism, which he had already pursued at the Scuola di Rialto. This literary production differs from the previous works by Valier in the

choice of simplicity in style and of the vernacular in terms of language and influences his later historical writings (e.g., the *Ricordi per lo scriver le historie della Repubblica di Venezia*, dedicated to Alvise Contarini, historian of the Republic, which present history as a source for moral advice and practical suggestions to follow in everyday life).

In the same years, Valier continued to exercise his episcopal role, visiting his diocese (see Archivio storico della Curia diocesana di Verona 2000 and 2001), and writing pastoral letters, collections of homilies, and rules for the clergy. In recognition of his activity, on 12 December 1583, Pope Gregory XIII elected him a cardinal. On this occasion, he wrote an oration (now lost) entitled *Concio de onere Episcopatus et Cardinalatus*, a description of the perfect Tridentine bishop and cardinal, represented by Carlo Borromeo (who died a few months after the election of Valier, as described in his *Vita Caroli Borromaei*: Valier 1988). In 1587 Sixtus V elected Valier a member of the Congregation of the Index, but despite this Valier did not interrupt his production of works on ethics and conduct, such as the *De occupationibus Sanctae Romanae Ecclesiae Diacono Cardinale dignis* and the *Quatenus fugiendi sint honores* (both addressed to Federico Borromeo, the cousin of Carlo). However, the most important texts written after his election are the *Philippus, sive de christiana laetitia* (two dialogues, set in 1591 Rome, dedicated to Filippo Neri and his *Oratorio*: Valier 1975), and the *De cautione adhibenda in edendis libris* (an autobiographical description of the life and works of Valier, dedicated to Silvio Antoniano and first published only in 1719). Even if this second text is presented as the last work written by the Venetian cardinal, between the composition of the *De cautione* and his death, Valier continued writing. His extraordinarily prolific production collects over 200 titles, both in Latin and in the vernacular, including letters, treatises, booklets, orations, dreams, eulogies, biographies, reports, and commentaries, which demonstrate his interest in different literary genres and different topics, such as the exegesis of the Scriptures, philosophy, conduct literature, historiography, and rhetoric. All his works preserve his personal view of humanism: a practical knowledge in which a perfect balance of letters,

philosophy, and religion can offer useful advice for prescribing and describing human behavior in contemporary society.

Agostino Valier died in Rome, on 23 May 1606.

Valla, Giorgio

Born: 1447, Piacenza

Died: 23 January 1500, Venice

Simon Smets

Ludwig Boltzmann Institute for Neo-Latin Studies, Innsbruck, Austria

Abstract

Giorgio Valla was a fifteenth-century humanist who studied and worked in Pavia, Genoa, and Venice. He established a remarkable collection of manuscripts that fuelled his study and translation projects. Although he also provided commentaries on Cicero and Juvenal, Valla focused on Greek scientific texts, which he translated into Latin. From around 1470 until his death, Valla was also occupied with writing an encyclopedia in which he collected all his knowledge based on mainly Greek authors. The encyclopedia's lack of structure and the philological errors have provoked harsh criticism from the Renaissance until modern times, but it was nevertheless read by the greatest early modern scientists during their formation.

Biography

Giorgio Valla was born in Piacenza in the autumn of 1447, shortly after the death of Filippo Maria Visconti. After the attack on Piacenza by Francesco Sforza, Valla's family fled to Vigoleno. There, the talented young man would be educated

from 1457 until 1462 together with the son of Alberto Scotto, the count of Vigoleno. Valla then moved to Milan, where he became the pupil of Constantine Laskaris for 3 years. He further met Cicco Simonetto, Secretary of Francesco Sforza, and Gian Giacomo Trivulzio, later Marshal of France under Louis XII. To him, he would dedicate a commentary on Cicero's *De Fato* (Cicero 1485), and they exchanged ideas on Livy and Caesar. Another notable figure with whom Valla acquaints himself during his Milanese years is Jacopo Antiquari from whom he will receive support further on in his career. In 1466, Valla moves on to Pavia, where he studies and teaches Greek with Andronikos Kallistos and physiognomy, mathematics, and natural sciences with Giovanni Marliani, who puts him into contact with other humanists among whom Francesco Filelfo. After an interval of a year from 1477 to 1478, during which he teaches rhetoric at the University of Genoa, Valla returns to Pavia. He becomes the tutor of Cicco Simonetta's children and is appointed Maestro di Umanità at the university until 1484. In 1485, Valla moves to Venice, where he replaces Giorgio Merula at the San Marco School. It was Ermolao Barbaro who advised the committee in favor of Valla's appointment, and the two humanists would remain on friendly terms during the following years. Valla's stay in Venice coincided with his most prolific period (Heiberg 1896; Gardenal et al. 1981; King 1986). Now at the heart of Italy's book industry, he was able to put his editorial and translation work in the service of printers like Aldo Manuzio, who acknowledged more than once the value of the humanist from Piacenza (Raschieri 2012). Valla started a friendship with Lorenzo Loredan and counted among his students Vittore Pisano, Giovanni Antonio Flaminio, Pontico Virunio, Gaspara Contarini, and Giovanni Pietro Valeriano. They would have followed Valla's courses on Cicero's *Rhetorica ad Herennium* in 1490, on Pliny's *Historia Naturalis* a year later, and on Vitruvius, Euclides, Plautus along with Cicero's *Orator* in 1492. In 1496, Valla lectured on Aristoteles' *Poetica* and *Magna Moralia*. It is also the year in which he was imprisoned on the charge of espionage for the

French King, who at that time was in conflict with Venice and Milan. Apparently, it was Valla's friendship with Trivulzio that lay the basis of this accident. He was finally acquitted of all accusations, and in October, after 8 months of imprisonment, he was released. He subsequently got back his teaching position, and 3 years later he would lecture on Cicero's *Tusculani Disputationes*. Valla died on 23 January 1500 and was replaced at the San Marco School by Marc Antonio Sabellico (Heiberg 1896; Gardenal et al. 1981; King 1986). Bartolomeo Zamberti took care of the funeral laudation, in which he abundantly praised his deceased teacher and friend (Rose 1976). Valla's encyclopedia was posthumously published in 1501 by his adoptive son Gian Pietro Cademusto, who also wrote a biography of him (Heiberg 1896).

Heritage and Rupture with the Tradition

While living in Venice, Valla had the opportunity to acquire a remarkable collection of manuscripts, that was well known all over Italy. Two book hunters in service of the Medici, Giano Laskaris and Angelo Poliziano, visited Valla in respectively 1490 and 1491. Some of his volumes came from Bessarion's library, others were acquired from Byzantine immigrants and traders who had brought them in from, for example, Constantinople. The most famous exemplar is the codex A of Archimedes, which is now lost, but Valla also possessed Heron's *Pneumatica* and made use of the Sophocles manuscript *Mutin.* α.U.9.19 (Gr. 99). After his death, the books were acquired by Alberto Pio di Carpo, and a substantial part of them is now in the Biblioteca Estense (Heiberg 1896; Cataldi Palau 1994; Tessier 2003; Bellé et al. 2014; Rose 1973).

Valla's bibliophile interests furnished him with the material to pursue cutting-edge research and translation projects. For example, his 1486 commentary on Juvenal's *Satires* relied on hitherto unknown scholia which he attributed to Probus (Anderson 1965). His possession of the *Parisinus Graecus* 1807, containing a portion of Plato's works, allowed him to comment on Cicero's

Timaeus while making use of the original Greek dialogue (Pagani 2008). For his first-ever Latin translations of Archimedes, Eutocius, Hero, Manuel Bryennius, and numerous other Byzantine and classical Greek authors, he could also rely on his personal library (Rose 1975; Gardenal et al. 1981).

Apart from the usual humanist interest in Latin classical authors like Juvenal, Cicero, and Plautus, Valla's real focus point was Greek scientific texts. Probably inspired by his former teacher Marliani, he translated Galen, Hypsicles, Alexander of Afrosdias, Nicephorus Blemmydes, Euclid, Proclus, Aristarchus, Cleomedes, Eusebius, Psellus, Rhazes, Ptolemy, Hippocrates, Timaeus of Locri, and others (Heiberg 1896; Gardenal et al. 1981). While some of these works appeared independently or bound together with either originally Latin texts or translations by different people, (Galen 1481; Aristotle 1488, 1496; Cleonides 1497; Alexandrus of Afrosdisia 1994), twenty-five of them were printed together in 1498 at the presses of the Venetian printer Bevilacqua, each with their own dedication letter (Nicephorus et al. 1498). Alongside the majority of treatises on medical topics, mathematics, astronomy, and music theory, the miscellany also includes logic, rhetoric, theology, and ethics (Nicephorus et al. 1498). In addition to these translations, Valla added one work of his own, namely *De expedita ratione argumentandi*, a scholastic work on rhetoric that is based on Nicephorus, Cicero, Quintilian, Fabius, and Aristotle (Vasoli 1960; Gardenal et al. 1981).

Valla's *magnum opus* was his vast encyclopedia *De expetendis et fugiendis rebus*. It was divided into seven heptads, and the largest Aldine volume ever. In its earliest stage, during the second half of the 1470s, *De expetendis* was titled *Quibus rebus humana perfecta sit foelicitas*. The ethical character of these two titles indicates the encyclopedia's attempt to forego "a sectorial vision of sciences" in order to reach a balanced harmonization of mundane reality and the human knowledge thereof (Raschieri 2012). The work attempts to provide a compendium of all knowledge, molded in a system of subdivisions that fitted well into the Aristotelian tradition that

prevailed in Venice and Pavia (Gardenal et al. 1981; King 1986).

According to *De expetendis*, man's felicity is subdivided into matters that pertain to the soul, the body, and external goods. For the soul, Valla names *veritas*, *virtus*, and *affectus* as the tripartite goal, of which *veritas* can be reached by means of the *mens*, *ratio*, *intellectus*, *iudicium*, *consilium*, *ingenium*, and *opinio*. These are the tools for knowledge, of which Valla discerns two kinds: knowledge about things that are external to us (of a metaphysical or scientific kind) and things that pertain to ourselves (morals, economics, politics, and the trivium cum poetics). Books I–XXXIII are devoted to arithmetic, music, geometry, astronomy, physics, and medicine – book XXII was finished in 1491; books XXXIV–XL contain grammatic, dialectic, poetics, and rhetoric; XLI–XLIII are about moral philosophy and were finished in 1494; book XLIV discusses economy; books XLV–XLVII have politics as their subject; and the last book before the conclusion, book XLVIII, is devoted to physiology and psychology. The work was probably finished by 1495, but Valla did not succeed in revising it for publication before his death (Heiberg 1896; Gardenal et al. 1981; Mauro 1995).

The largest part of the encyclopedia is taken up by the exact sciences, for which Valla draws much on his unique manuscript collection with rarely to never studied Greek texts. He largely ignores the medieval and Arabic heritage and makes some disparaging remarks about their achievements (Gardenal et al. 1981). His choice of sources seems to be arbitrary and generally motivated by the rarity of the manuscripts. For his books on music, he relies on Cleonides, Aristides, but most prominently on the *Harmonika* by the fourteenth-century Byzantine scholar Manuel Bryennius, whom Valla could not date correctly. For the mythical origins of music, however, he gets his material from pseudo-Plutarch, and to explain the harmony of the spheres, he uses Ptolemy's writings as well as Macrobius' *Somnium Scipionis*. The Latin tradition is further represented in these books by St Augustine's *De Musica*, which Valla borrows from Giovanni Pico della Mirandola, Boethius' *De Institutione*

Musica, and also Martianus Capella's *De nuptiis Philologiae et Mercurii*. While the section on music is primarily concerned with the theoretical and speculative side, Aristides and Bryennius provide the sources for discussing also the technical aspects of audible music (Palisca 1985; Mauro 1995).

Music is followed by geometry, where the most important classical authors cited are Varro, Proclus, Hero of Alexandria, and Euclid. The next books, on astronomy, refer to Proclus, Cleomedes, Johannes Pediasimus, Ptolemy, Euclid, Porphyry, Demofilo, Autolycus, Hypsicles, Theodosius, Antiochus, Heraclitus, Aetius of Amida, Hippocrates, and Vettius Valens (Ruffo 1977). On this subject, we also find the odd moment of original thinking by Valla, on, for example, doubling the cube and squaring the circle (Gardenal et al. 1981). The largest section, consisting of seven books on medicine, depends heavily on again Byzantine compilers, namely Paulus of Aegina and Aetius of Amida whose references to Galen Valla recycles. Celsus is the only Latin author of whom he makes extensive use, while Pliny only provides the necessary vocabulary (Gardenal et al. 1981). In the section on poetics, Diomedes and Horace are Valla's main guides, while Aristotle is only used partially without a single mention of his concept of mimesis (Tigerstedt 1968).

Impact and Legacy

Despite his interest in collecting valuable manuscripts, Valla was not always able to make use of the most authoritative copies of a specific text. His translation of Aristotle's *Poetica*, contained in the 1498 miscellany of translations (Nicephorus et al. 1498), might have been the first Latin version of the work that appeared in print, but it was based on an inferior Greek manuscript. Furthermore, Valla's knowledge of the Greek language was not always sufficient to cope with such a difficult work, and his translation was superseded by a new and better one already in 1536 (Tigerstedt 1968). His lack of understanding and philological flaws have been recognized by scholars from the sixteenth century until our age. Paolo Giovio

denounced the chaotic ordering of the translated excerpts in *De expetendis* and in a collection of Gilles Ménage's sayings, edited by Bernard de le Monnoye, we find a sharp epigram that criticizes the encyclopedia as a book to be shunned (Ménage and de la Monnoye 1715; Giovio 2006). In modern times, Heiberg (1896), Gardenal et al. (1981), and Palisca (1985) also questioned Valla's abilities. The heavy encyclopedia without page numbering was furthermore difficult to use and was never reprinted (Gardenal et al. 1981).

His translation projects have nevertheless contributed to the establishment of a lasting scientific lexicon that is based on Latin (although Valla did not refrain from Grecizing neologisms or calques). Indeed, for most of the subjects that *De expetendis* covers, traces of its influence can be identified in the work of later scientists. For example, Francesco Maurolico makes use of Valla's encyclopedia in his *Hippocratis tetragonismus*. As *De expetendis* was the means by which Maurolico became acquainted with Euclid's work, and also provided him with a specific proof for the law of reflection, we could say that Maurolico was perhaps the mathematician who was most influenced by Valla. Valla's innovative inclusion of optics and mechanics within the *quadrivium* furthermore inspired Maurolico to explore in his own work the idea of the geometrization of nature. Also within the mathematical field, Johann Werner's and Pedro Nunes' discussions of the mean proportional and the conic section draw on Valla's geometry chapters (Bellé et al. 2014).

In music, Valla was the first one since Boethius with enough knowledge of Greek and with all the necessary manuscripts at hand to discuss in-depth the *tonoi* theory. However, he fails to make a critical comparison of his sources, Ptolemy, Bryennius, and Cleonides. He consequently enhances the readers' misunderstanding and thus fails to engender a revaluation of the Greek tonal system. His publication of Cleonides' *Harmonicum introductorium* in Latin translation introduced a musical theory that was independent of the Byzantine and Medieval traditions. This work did, however, not find its way into *De expetendis*, and there are no indications in the

form of marginal annotations that Valla understood the work. Its first readers don't seem to have taken anything from it either. A method to establish ratios from the geometrical section of *De expetendis*, however, was used by the sixteenth-century music theorist Gioseffo Zarlino to develop a tuning method that makes use of the mesolabe (Palisca 1985).

Nicolaus Copernicus also profited from Valla's translations. They helped him to master the Greek language and for his *De revolutionibus* (1501), he used Valla's Latin rendition of Pseudo-Plutarch's *De placitis philosophorum* in *De expetendis*. He also used the 1498 miscellany of translations (Nicephorus et al. 1498), from which he took a mistaken calculation of Mars' revolution around the sun. Copernicus seems to have been aware of the inaccurate character of Valla's work and never mentions Valla's name but instead refers to him with *nonnulli* (Rosen and Hilfststein 1995; Goddu 2010). It is further noteworthy that Leonardo da Vinci used *De expetendis*, in which he read about pneumatic automata, optics, lunulae, and perhaps also the idea that science is dependent on the intellect as well as on experience or experiments (Tucci 2008; Scarpati 2000).

Valla's minor work on rhetoric, *De ratione argumentandi*, contained in the 1498 miscellany of translations (Nicephorus et al. 1498; Valla 2017), had some success after it was added to George of Trebizond's *Dialectica ex Aristotele*. It was printed with glosses by Peter Schade and praised for its educational usefulness by Sixt Birck in a prefatory letter to the 1529 Basel edition. The latter also used it in his teachings, while in the work of Giovanni Paolo Cesario and Philip Melanchton, at least citations from *De Ratione* can be found (Gardenal et al. 1981).

Abstract

Lorenzo Valla played a considerable role in the Renaissance humanism for three principal reasons: he contributed to transforming the art of grammar within philology; he closely linked the art of argumentation to its expression in

a historically determined language; and he considered the place of pleasure, understood in the Epicurean tradition, in the conception of earthly happiness and celestial beatitude. Firstly, the development of the philological consciousness leads Valla to consider that language is not only the means of thought's expression but also an essential moment in its elaboration. Therefore, the art of argumentation must abandon the obscure formality of the medieval dialectic and adhere to the real-life requirements of political, moral, and juridical discussion in a precise but ordinary language, proper to common sense.

Consequently, Valla proposes the emendation of the logic practiced in medieval universities along with its replacement by a new art of argumentation, which decomposes and recomposes the functions of rhetoric and dialectic. It is a matter of elaborating an art of argumentation suited to ordinary life's contingent and uncertain situations, characterized by controversy. It is necessary therefore to devise an art of argumentation that allows deducing plausible conclusions, while at the same time elaborating credible proofs. In this respect, Valla attempts to link the credibility of the proofs with a reasoned agreement. Finally, Valla's defense of pleasure as a form of increment, and as a growing satisfaction, implies that "the useful" takes on the signification of the search for a particular benefit for one's self, for a reward, or even for one's own interest. In the same way, the modality of pleasure specific to celestial beatitude consists of a kind of benefit, namely, a constant and peaceful intensity.

Biography

Lorenzo Valla was born in Rome in 1406. His father was a lawyer working at the papal court. Valla moved to Pavia in 1431, where he taught rhetoric. However, Valla was a polemical and quarreling mind which made him many enemies in Pavia, Rome, and Naples. In 1431 Valla wrote *De Voluptate* (the second edition dating ca. 1441–1449 under the title *De vero falsoque bono*.) In 1433 Valla moved to Naples, at the

Aragonese court. He remained in Naples till 1447. In this phase of his life, Valla wrote a lot of significant works, especially *Elegantiae linguae latinae* (1435–1444); *De libero arbitrio* (1435–1439); *Dialecticae Disputationes* (first edition 1439; second edition ca. 1444–1449); and *De falso credita et ementita Constantini donatione* (1440). Valla returned to Rome in 1447, where he wrote *In Novum Testamentum Adnotationes* (1449) and became, in 1455, a secretary of Pope Nicholas V. He died in 1457.

Heritage and Rupture with the Tradition

Because he was a polemic and combative mind, Valla thought that the works of ancient culture, whether sacred or pagan, had come down in a fragmentary, sometimes corrupted, manner. Grammar, the art of correct spelling, needed therefore to be transformed into an art of restitution and correct understanding of its authentic signification. In order to do so, knowing the cultural context of the genesis of the work, the history of the language and its semantic pertinence, or what Valla calls "elegance," was necessary. The *Elegantiae linguae latinae* ("Elegances of the Latin Language") aimed at restoring the semantic precision of Latin, corrupted by medieval culture, all the while underlining the polysemy and the historical development. It is precisely the examination of an utterance's cultural context and the analysis of the lexical and historical pertinence of expressions that allowed Valla to denounce, in his *De falso credita et ementita Constantini Donatione* ("On the Donation of Constantine," 1440), the document, allegedly from Constantine, which ceded a large portion of the Empire to Pope Sylvester, as a fake dating from the eighth century. The same critical attitude is found again in the *Collatio Novi Testamenti Adnotationes* ("Remarks on the New Testament," 1449), where this or that biblical passage is analyzed from a philological point of view.

Innovative and Original Aspects

The development of the philological consciousness leads Valla to consider that *language* is

not only the means of thought's expression but also an essential moment in its elaboration. Consequently, the art of argumentation must abandon the obscure formality of the medieval dialectic and adhere to the real-life requirements of political, moral, and juridical discussion, in a precise but ordinary language, proper to common sense. In this way, in his *Repastinatio dialectice et philosophie* ("Dialectical Disputations" 1439 literally the "re-tilling" of the dialectic and of philosophy), Valla proposes the emendation of the logic practiced in medieval universities along with its replacement by a new art of argumentation, which decomposes and recomposes the functions of rhetoric and dialectic. It is a matter of elaborating an art of argumentation suited to ordinary life's contingent and uncertain situations, characterized by controversy. In this context, the necessary conclusions of the analytic syllogism are not valid. It is necessary therefore to devise an art of argumentation that allows deducing plausible conclusions, all the while elaborating credible proofs. In this respect, Valla doesn't prescribe the search for public approval obtained through the manipulation of the passions but rather looks to link the credibility of the proofs to a legitimate and thought-out agreement. This is why his project remains above all dialectical and not rhetorical. In effect, rhetoric, as the art of persuasion and of plausible argumentation, ensures the communication of arguments. In this way, the first condition of persuasion is the intelligible nature of the language in which the arguments are expressed. Thus, common opinions and value judgments specific to a community that finds herself held in the semantic and lexical "treasure" of a historically given language must constitute the starting point of any controversy.

The opposing parties must above all be in agreement about the significance of the controversy and the terms that define it. The notion of *consuetudo*, taken up from Quintilian, defines for Valla the requirement that the interlocutors understand each other while they discuss, because they understand the same signification of the terms used: they speak of the same thing. A valid signification then is a signification confirmed by common sense and the cultural tradition of a language.

In this respect, Valla maintains that numerous philosophical conflicts about being and essence, and about transcendentals or categories, depend on the inappropriate usage of terms. Philosophy and theology require first off a philological effort and a critique of emendation.

Yet, invention (*inventio*) is the mother of arguments and always refers to an analytical process: we want to demonstrate a certain thesis, and we look for (in order to invent them, find them) the most plausible arguments in order to convince others. The method of invention is both rhetorical and dialectical, because it uses "areas" (*loci*) that are common to the two arts. The areas are schemata of intelligibility that allow elaborating the most convincing arguments for all controversial subjects: they can be provided by causes, similarities, consequences, means, etc. These areas are linked to the usage of maxims, which don't express laws but rather valid rules for most cases and that are easily understandable by the public. However, as the grammarians are not limited to studying syllables and letters, so too must the orator not be limited to knowing these areas: he teaches himself to use them in an appropriate manner, in adapting them to specific situations.

But the requirement of presenting credible proofs leads Valla to underline the dialectic's criteria of validity: interrogation and refutation. The dialectic is, for Valla, as for Aristotle, the unique art of critical discourse because it is essentially a method that tests arguments, whether it is a matter of one's own arguments or the arguments of the adversary. But, unlike the Aristotelian dialectic, Valla considers that argumentation's modalities must be deontic: they must include not only the true or the false, the necessary, or the possible but also that which is agreeable, useful, and habitual. These elements don't refer to a criterion of probability, but rather to a form of plausibility defined by what occurs most of the time. This expresses the horizon of meaning of a historical community, its value judgments, and its subdivisions of signification that are translated into its institutions, of which the language just as the law are the essential manifestations.

The anchorage in the reality of controversies and requirements of life together is equally found again in the conception of happiness. Valla, in his *De voluptate* ("On Pleasure," 1431) renamed *De vero falsoque bono* ("On the True and False Good," 1433), introduces Epicurean elements (as well as Lucretian, for Lucretius' work "On the Nature of Things" had been discovered in 1417 by Poggio Bracciolini) in his conception of worldly happiness and celestial beatitude. The text is built as a Ciceronian dialogue, expressing three points of view. In Valla's work, however, the Epicurean celebration of pleasure, that the other Hellenistic schools, both Greek and Roman, had fiercely criticized, predominates. In effect, all the while looking for a specific human natural foundation in order to legitimize moral norms, the Stoics as much as Cicero refuse to recognize the moral foundation in pleasure, which is considered an animal expression and an egotistical compulsion, barring the route to all living together. On the other hand, the foundation is given by a sort of proximity with oneself (the *oikeiosis*) that is closely linked with the desire to protect and to ensure the development of one's near and dear, or even of one's city. The familiarity with one's self implies then a form of altruism and founds living together. Usefulness is not considered here as the manifestation of the search for one's own interests, but as the expression of the collective effort to carry out the common good.

In this respect, Valla's originality consists in defending pleasure as a form of increment and as a growing satisfaction that guides our actions, in such a way that the useful takes on the signification of the search for a particular benefit for one's self, for a reward, or even for one's own interest. Selfishness is solidly anchored in human nature: this is a fact. Valla, therefore, leaves out the principal definition of pleasure for Epicurus, namely, that of the absence of pain. This criterion is insufficient for Valla, and it was criticized as contradictory already from antiquity. Pleasure is, on the other hand, fullness, satisfaction, intensity, and joy. The sum of pleasures is the guide of our earthly lives. Since the useful and pleasure intersect, Valla transforms the Epicurean hierarchy of pleasures between necessary and natural

pleasures, natural and non-necessary pleasures, and pleasures that are neither necessary nor natural. For Valla, natural but non-necessary pleasures and the pleasures that are neither necessary nor natural take on crucial importance in worldly life, for happiness closely depends on acquired benefits and secondary goods that make life joyful and agreeable (like riches, fame, friendship).

In the same way, the distinction between pleasures in movement and stable pleasures acquires a new signification, since they don't define two different modalities of pleasure, but rather two areas: whereas pleasures in movement characterize the worldly existence, stable pleasures define, for Valla, the modality of pleasure specific to celestial beatitude, which consists more in a constant intensity and perfection with nothing leftover as in a contemplative state. Stability therefore no longer defines, unlike the Epicurean philosophy, cosmological equilibrium or imperturbable tranquility of the sage but rather the joyous and eternal accomplishment of the blessed.

The historiography around Valla is highly controversial, in part because of the provocative and polemic nature of his writings, which don't truly fill their claims of originality. Nonetheless, Valla opened new paths in the field of philology, in the semantic and historical study of the Latin language, in the reform of the art of argumentation, and in the domain of morality, in affirming, by means of pleasure, the compatibility between worldly happiness and celestial beatitude.

Impact and Legacy

Valla's philological, critical approach had a noteworthy impact on the humanist grammarians and philosophers such as Angelo Poliziano (1454 [Montepulciano]–1494 [Florence]), Erasmus of Rotterdam (Basel, 1466?–1536), and Thomas Hobbes (1588 [Westport]–1679 [Hardwick Hall]). His polemical criticism of Aristotelian and scholastic tradition and his interpretation of the link between rhetoric and dialectic influenced the art of argumentation in the Renaissance. In this regard, Rodolphus Agricola (1444 [Baflo]–1485 [Heidelberg]) and Pierre de la Ramée (1515

[Cuth]–1572 [Paris]) were the lawful inheritors of Valla's reform of argumentation.

Van Helmont, Jan Baptiste

Born: Before 12 January 1579, Brussels

Died: 30 December 1644, Brussels

Sietske Fransen

Centre for Research in the Arts, Social Sciences and Humanities (CRASSH), University of Cambridge, Cambridge, UK

Abstract

The Flemish physician Jan Baptiste van Helmont is one of the most important followers of Paracelsus. Van Helmont had a major influence on the iatrochemical movement in early modern Europe. His most important book *Ortus medicinae* was published posthumously and sets out his medical, philosophical, and religious worldviews. He is famous for inventing the concept and word *gas*.

Biography

Jan Baptiste was born as the youngest son in a Catholic noble family in current-day Belgium. His youth was overshadowed by the early death of his father and the onset of the 80-years war. Against the will of his mother, he pursued his studies in medicine at the University of Leuven. He finished his university education officially in 1599 but did not accept his degree until 10 years later. This was because he felt compelled to compensate for what he saw as the shortcomings of the university education by traveling through Europe and reading all books he thought were necessary for obtaining a medical degree. By the time he took his degree in 1609, he had married Margarita van Ranst and moved to Vilvoorde where he practiced medicine and set up his own laboratory. Five of his six children were born here before he moved the family back to Brussels. His fifth child and youngest son Franciscus Mercurius (1614–1698) became his most important ambassador after his death on 30 December 1644.

Van Helmont published several treatises between 1621 and 1624, most famously the *De magnetica vulnerum curatione* [On the magnetic cure of wounds] (Paris 1621) in which he described the natural cause of the weapon salve based on magnetism. This treatise gave rise to an allegation of heresy and became a source of major problems for the rest of his life. Led by the Jesuit Jean Roberti, a group of theologians, mainly from the University of Leuven, judged Van Helmont's work to be anathema to church doctrine. Van Helmont appeared three times for the archiepiscopal court in Mechelen. During this period he was not able to publish and lived several years under house arrest. However, several of his autographs that were confiscated by the ecclesiastical court can still be found in their archives in Mechelen. In 1642 he published the first of four influential treatises, on fevers, the stone, the plague, and the four Galenic humors. The set of four was published in 1644 as *Opuscula medicina inaudita* [Small medical works, previously unheard off]. They were reprinted as part of his largest work, the *Ortus medicinae* [The Rise of Medicine] (Amsterdam 1648), posthumously published by

van Helmont's son. Another 11 years later, Van Helmont's Dutch work *Dageraad* was published. The story goes that van Helmont had given this Dutch work to one of his daughters during his life. A friend subsequently discovered the manuscript and immediately brought the manuscript to the printer.

Van Helmont is in current historical studies especially known as an alchemical author and follower of the Swiss physician Paracelsus (1493–1541). In his own laboratory, he experimented with alchemical and medical recipes, procedures, and methods. He described these in his writings which all bear medical titles yet contain diverse material touching upon other fields. These works expound not only upon medical ideas based on Hippocrates as well as Paracelsus but also develop a full philosophy of the world, human beings, the soul, and the body. In accordance with Neoplatonic ideas, he placed the faculty of “intellect” as the image of God at the pinnacle of human nature, whereas “reason” in van Helmont's philosophy has no such status. Van Helmont's rejection of scholastic medicine complements arguments against Aristotelianism and the use of mathematics for complex processes throughout his works, together with suggested reforms in education and methods for acquiring new knowledge, namely, by experiment and experience. His methods of quantification of his experiments have been important for later developments in chemistry and science in general. The many new concepts and ideas discovered and invented by van Helmont were given new names by him, in both Latin and his native tongue Dutch, with the most famous surviving term being “gas.”

Vanini, Giulio Cesare

Born: Taurisano, 1585

Died: Toulouse, 1619

Francesco Paolo Raimondi
Classical Lyceum, Lecce, Italy

Abstract

With his restless spirit, feeling vested with the civil task of a profound political and cultural renewal of human beings and society, Vanini, at the dawn of the modern age, conducts a systematic demolition of Medieval and Renaissance theological learning from the perspective of radical rationalism, almost pre-Enlightenment, and paves the way for a refoundation of learning on the basis of the autonomy of reason and nature, with often

subversive outcomes of the ethical and cultural values of the Christian tradition.

Biography

Born in Taurisano (Lecce) between January 19 and 20, 1585, of Giovan Battista and Beatrice Lopez de Noguera, in 1603, Giulio Cesare Vanini took vows under the name of Gabriel in the Neapolitan convent of Carmine Maggiore; a few years later, on June 1, 1606, he graduated in civil and canon law at the College of Doctors, then joined to the *Studium* in Naples. After February 1610, he moved to Padua in order to attend the academic courses in Theology or perhaps in *Artibus*. But on January 28, 1612, his expectations were rudely interrupted by a severe disciplinary measure from the General of the Carmelite Order, Henry Silvio, who aimed at relegating him to a dark convent of Cilento. In association with his brother Giovanni Maria Ginocchio, Vanini preferred to escape to England, where perhaps he hoped to establish himself as a philosopher – theologian, critic of the principles of the Council of Trent. The escape route was carefully planned by the English Ambassador in Venice, Dudley Carleton, who entrusted him to the care of his friend John Chamberlain and placed him under the protection of the mighty Primate of England, George Abbot, Archbishop of Canterbury, which gave him hospitality at Lambeth Palace after he arrived in London, on June 20, 1612. On July 8 of the same year, Vanini pronounced the abjuration of Catholicism in Mercers Chapel.

The difficult relation ship with Abbot induced Vanini to come into contact with the Catholic world again by means of the Spanish ambassador in London, Don Diego Sarmiento de Acuña, and the Nuncio of France, Roberto Ubaldini. In March of 1613, he had sent a memorial to Paul V, unfortunately lost, the contents of which are made known to us by a report from the Congregation of the Holy Office (Archives of the Congregation for the Doctrine of the Faith, S. O., Decrees, 1613, ff. 166 and 168). We thus know that with his brother Ginocchio, he asked the Pope for absolution *in foro fori*, to be released from the vows of

the religion of Carmel, and for the opportunity to wear secular clothing or priestly cassock. His proposals were examined by the Holy Office in its sessions on April 11 and August 22, 1613 (Decrees 1613 ff. 413–414), in which the Pope granted them pardon on the condition of their spontaneously appearing, and formally renouncing the Anglican religion.

Having become aware of his attempt to leave England, on February 2, 1614, Abbot placed Vanini under arrest, first in Lambeth Palace and later (from February 14) in the Gatehouse. On February 15, 1614, he brought Vanini to trial before the High Commission. From the minutes of the *Second examination* (Archives of the Archdiocese of Westminster, Series A, XII, no. 23 ff. 49–52), we learn that Vanini was suspected of having had contacts with a few Catholics imprisoned in Newgate. He was charged with antitrinitarianism and Arianism Calvinism and British Puritanism, and that he was a miscreant because he left in his cell the books by Machiavelli and Pietro Aretino “super institutiones” (with obvious reference to the *Prince* in the case of the first and to *The reasoning of the courts* in the latter case).

Having escaped the Gatehouse with the support of the Spanish Ambassador and with the secret consent from King James I of England, Vanini goes to Ubaldini, asking to publish with the permission of the Congregation of the Holy Office the *Apologia pro Concilio Tridentino*, in 18 books, unfortunately lost. However, the Church authorities show some interest, rather than in examining the text, in bringing the ex-apostate to Rome for trial before the court of the Holy Office. This is, in fact, the hint of the Apostolic Nuncio (letter of July 31, 1614, to the Roman Inquisitor, Giovanni Garzia Millini), and this is also the proposal of the Pope (decree of the Holy Office, dated August 28, 1614, Archives of the Congregation for the Doctrine of the Faith, SO, Decrees 1614, ff. 420–421). Vanini is careful not to get to Rome and stops in Genoa, where he makes friends with Scipione Doria, who entrusts him with the task of teaching philosophy to his son Giacomo. On January 19, 1615, following the arrest of Ginocchio ordered by the Genoese inquisitor, he feels targeted by the Holy Office.

He hastens to leave the Republic and goes to Lyon, where he publishes the *Amphitheatrum*.

After a further meeting with Ubaldini in July of 1615, he finally breaks the connection with the Nuncio and seeks protection and success in the *milieu* of kingly courts and in the libertine circles which proliferated in the French capital. Paris opens to him the doors of the coveted success and offers the protection of leading personalities such as Arthur D’Epinay de Saint-Luc, François de Bassompierre, Nicolas Brûlart, the Earl of Cramail, and lastly the Duke of Montmorency. Within this cultural *milieu*, Vanini was able to breathe the atmosphere of intellectual freedom which led him to edit the *De admirandis reginae deaeque Mortalium arcanis*, published by Adrien Perier on September 1, 1616. The book had an immediate *succès de scandale*, but just one month after publication, the Theological Faculty of the Sorbonne intervened with a sentence (Archives Nationales de France, Reg MM 251, 1608–1633, f. 68). Forced to seek a safer refuge, Vanini moved into the strongly Catholic Toulouse under the protection of Cramail.

On February 9, 1619, by which time the normalization policy of Louis XIII could no longer tolerate the extremes of Vanini’s radicalism, Toulouse reserved him the tragic end of the stake. Arrested by the *Capitouls* Paul Virazel and Jean d’Olivier on August 2, 1618, and submitted to the *Cour de Parlement*, he was sentenced under the guise of Pomponio Usciglio, perhaps because the Court became convinced that the name Julius Caesar had been adopted by the philosopher in order to rise as a new Caesar, conqueror of Gaul to the word of atheism. On that same day in the *Place du Salin*, the executioner performed carefully the sentence: cut off the tongue of the condemned with pincers, hung him from the gallows, burned him on the stake, and, finally, scattered his mortal ashes to the wind.

Vanini’s Atheism Between Criticism of Tradition and Civil Engagement

The introductory pages of the *Amphitheatrum* and *De admirandis* lead us to suppose that the

philosopher developed his own thinking in close correlation with his own historical time. The experience of living in London, in contact with the intransigence and the rigorism of the most extreme wing of English Puritanism, and the Parisian stay, which occurred during the most tragic years of the regency of the Queen Mother, who did not hesitate to unleash a bloody civil conflict, placed the Salentino face to face with the heavy moral, political, and religious crisis which gripped Europe in the early seventeenth century.

He identifies the roots of this European crisis in the cultural tradition of Christian theology of the Middle Ages and Renaissance, which, subject to critical investigation, appears to him interwoven with lies and deceit, fraud and falsehoods, and imposture and superstitions. Unlike other spirits of the time, who stick to the generic, deistic (e.g., the libertines), or irenistic formulas that remained, at any rate, within that tradition, Vanini arrives at theoretical atheism, understood as a liberating and emancipatory philosophy, able to close a historical process and usher in a new set of values for the modern age. He presents himself as an innovator, the bearer of a new philosophy marking discontinuity and a sharp break from the past. He is convinced that the battle for the liberation and emancipation of humanity can assume only the anti-historical function of demolition of the ideological-cultural heritage of the Christian West. In this attitude, which could be defined as pre-Enlightenment, we find the deepest motivation for that critical and destructive dimension of his thinking, often mentioned by its interpreters. The legacy of medieval and humanist-Renaissance ages crumbles shattered: he demolishes the myth of anthropocentrism; unhinges the principles of Christianized Platonism; shakes the pillars of concordist Aristotelianism; dismantles the construction of a compact, finite, harmonized universe, having at its summit God and the choir of angelic Intelligences; crushes any form of teleology; discredits the myth of human supremacy among the living beings; shatters the most established principles of Christian ethics, and unmask the illusions of magic and of astrology.

The dismantling of the cornerstones of Christianity is accompanied by a return to ancient times

for at least two reasons. The first is that Vanini feels the need to reconnect modern atheism and the ancient approach (“*Veteres philosophi [...] ut qui illorum praesidio innituntur moderni athei,*” *Amph.*, 1615, p. n.n. 17). It is no coincidence that he mentions in the *album atheorum* thinkers such as Cicero, Protagoras, Diagoras, Diodorus of Sicily, Luciano, Pliny, and among the moderns, Machiavelli and Cardano. The second reason is that ancient philosophy is the ground on which it is possible to recover the natural reason which Vanini identifies with Aristotelian pre-Christian *ratio*, not yet bridled by the chains of religious categories. It follows that his thinking takes a rationalistic and radical shape because it does not detract any domain or privileged object from the critical scrutiny of natural reason. Excluding any supernatural or metaphysical dimension, modern atheism coincides, according to Vanini, with the construction of a new learning based on the two pillars of the autonomy of reason and autonomy of nature. In this perspective, he assigns to himself and to the emerging new century a subversive function of civil and intellectual emancipation. The introductory pages of the *Amphitheatrum* and of *De admirandis* insist on a drastic reversal of values: the age of ideological conflicts resulting from the proliferation of sectarianisms and heresies, emerging from the crucible of the Reformation, is finally closed. The novelty that advances is a *secretior philosophia*, which coincides with atheism, represented by the metaphor of lush vegetation that expands and invades the whole European world. The term *secretior* should not mislead: it has nothing to do with theosophical, platonizing, or neoplatonizing mysticism. The terminology of Platonic origin has in Vanini’s texts a mere function of coverage. Atheism is for Vanini the antidote to mysticism. It is *secretior* because, in order to escape the watchful censorship of the inquisitors, it disguises itself in the *chiaroscuro* of the technique of textual composition in which ambiguity and irony alternate with the mimetic game of simulation and dissimulation. In any case, Vanini’s key to understanding the modern world is quite clear: the age of the ideological predominance of religion, in his view, is superseded by a radical secularization process

of political and social values. It is significant that in the *nuncupatoria* to Bassompierre he presents his talent as a sapling that, having grown up in the barren soil of traditional philosophy, was unlikely to produce significant results, but revived under the action of the turgid and vigorous seed (“protuberante, turgenteque semine”) of atheism; this allowed him to go beyond the goals of ancient philosophers and to overcome the difficulties of modern ones (“Veterum philosophorum metas transiliens et recentiorum obstacula superans,” *De adm.*, 1616, p. nn 4).

But even more insightful are the pages of Dialogue 1, where the new philosophy (i.e., atheism) is presented as a sudden light that hurts the eyes of those who have long lived in darkness (“Fit laesio repentina, illata luce ijs, qui diu in tenebris commorati sunt,” *De adm.*, pp. 2–3). Even here the terminology is influenced by Platonic reminiscence, but in Vanini, it has connotations in the opposite direction, because the darkness is metaphorically traditional learning, and the theme of sudden enlightenment suggests the idea of a philosophical turn destined to fundamentally alter the sensitivity of modern humanity. The metaphor of the light alludes to a *Renovatio* which nevertheless no longer has colorings of a religious character but coincides with liberation from the lies and the frauds of the Christian tradition (“fraudes detegere, figmenta patefacere,” *De adm.*, pp. 369, 392, 442, 474). And the historical, moral, and civil task of the philosopher is to transmit at least one drop (“gutta”) of his own renewed learning to the younger generations (*De adm.*, 1616, p. 3).

Vanini's atheism is thus outlined on the basis of a new conception of humanity and the world. His universe is autonomous in its material composition and its constitutive principles of motion and rest. Vanini has in mind a mechanistic model; the world is understood, according to Lucretius, as a *machina* that has inside it and in the structure of its gears, not unlike those of a watch produced by German craftsmen, reliable and stable laws referring to an internal principle of movement. Just as materialistic and mechanistic is the model used to explain the functioning of living organisms, including humans. The physical and mental life

of humans is in a symbiotic relationship with the natural and human environment. The psychological characteristics depend on the food, habits, social customs, and transmission of the seed. The physical and mental life of humans is entirely internal to nature and to society not only in the sense that it is their product, but also in the most radical sense that nature and society are the only horizons within which human life develops and dissolves with the exclusion of any other extranatural dimension. The reasons for concluding in favor of the mortality of the soul are more consistent and stronger than those in support of immortality. The life of the mind is rooted in the materiality of the body and in the mechanistic motion of vital and natural spirits. The soul itself is nothing but *spiritus* which coincides with *aër* because *spiritus* springs from *spirare*, which is the material act of breathing (*De adm.*, p. 345).

The autonomy of reason and of nature is not real if it is not autonomy from the supernatural. Vanini severs at the root of the relationship between God and nature: he not only denies the creative act but also excludes the assistential, providentialistic, and teleological activity of a supernatural intelligence. God is not the ultimate aim of the universal order. Being autonomous, the cosmos is eternal and has no beginning and no end; it is not perfect, but it is, according to the famous paradox of Empedocles, perfectible precisely because of its imperfection. The *Amphitheatrum* is the text in which the most radical refutation of the idea of providence is conducted: in it all sorts of teleologism are rejected; there are no extraordinary interventions by divinity in the world, the distribution of good and evil is totally random, and miracles are either attributable to *causae naturales* or turn out to be frauds of priests and politicians; in the natural order, there is no trace of an intelligence or of an organizing will, as evidenced by the deformity studied by teratology. All is reduced to living and to vivifying matter, without hierarchies and degrees of reality, since the matter of which heavenly bodies and earthly ones are made is only one, down to the humblest such as the scarab. Life is the random effect of spontaneous generation. Human beings are no

exception; strictly rooted in the animal kingdom, they are also a random and spontaneous production of matter: their past is on all fours and in their soul, there is no trace of the divine imprint.

If God is not the ultimate aim, He is not even the first cause, neither in the sense of a free and contingent causality nor in the sense of a necessary causality. Vanini excludes, on the one side, Scotian voluntarism and contingentism and, on the other, Thomistic necessitarianism. If God were a free cause, or an absolute will, or an infinite might that has no limits or obstacles to His power, He would compromise the order of nature. If the natural order were preserved instead in its rigid regularity, God's free and absolute power would remain, in fact, inactive and without effect. On the other hand, free causality coincides with contingent acting. But if God can act or not act, if He can be determined now in one way or another, this means that He is from time to time, now indeterminate and now determined, and that in Him there is, as in us, the shift from indetermination to determination or the shift from one determination to another. But this implies imperfection and it is not compatible with the immutable essence of God. Nor is it possible that God is necessary causality, because otherwise the world would have been created from the time immemorial and would necessarily be co-eternal with God with the further consequence that the necessary causality would rule out human free will.

Vanini's next step is dismantling the traditional evidence of God's existence, from the cosmological *a posteriori* to the ontological *a priori*. The refutation of the ontological proof is not directed only against Anselmo, but also against Suarezian scholastic which had replaced the old question *An sit Deus?* with *quid sit Deus?* Vanini closely links the two questions of the theologian and shows how the response to the latter constitutes implicitly an answer to the former: defining the *quid* of divine essence means to emphasizing its inner contradiction and thus the impossibility of its existence. The same fate obviously concerns cosmological evidence. Evidence *ex motu* or *e pulchritudine universi* is null and void. They all clash with the impossibility that the eternal and

immutable entity is compatible with motion or with the novelty of Creation.

Of course, the *athéisme de théorie* does not fail to be accompanied by peaks of an irreverent nature which turn Vanini's philosophy into a philosophy of unmasking: to expose the frauds and lies is its most subversive feature. Its privileged targets are the religions that, having originated from fear (Primos in orbe deos fecit timor, *De adm.*, p. 366), belong to the world of fiction. And Vanini's weapon is derision, to the points of sarcasm, subtle irony, and the intention to demystify and desacralize everything. He does not save even the biblical text, equated to Aesop's fables; indeed, he points out, not without a mischievous satisfaction, that no one has ever found its original. The Solomonic verses, far from being discoverers of divine wisdom, are lascivious, inelegant, devoid of any rational value just full of popular proverbs. The narration of the creation of the world by Moses is worthy of sponge and of coal; biblical resurrections are stories embellished *fusco sanctitatis* or are related to apparent death phenomena.

Human Knowledge and Divine Knowledge: The Antimetaphysical Structure

Vanini's philosophical horizon is not only anti-theological, but it is also antimetaphysical. This means that he not only excludes the existence of a free and intelligent will but also the complex array of necessary and eternal essences of classical metaphysics. The test bench for the antimetaphysical battle is that of gnosiology or better of the opposition between human and divine knowledge. The instruments of human knowledge are *ratio* and *experimentum*, that is to say, reason and sense. Reason is, as already mentioned, the *ratio naturalis* which is autonomous, anti-dogmatic, and critical; it is not of divine origin nor is it absolute and abstract; it is a flexible and malleable tool, able to capture the multiform variety of nature in its own becoming. Fitted entirely within the human and mundane horizon, reason is no longer opposed to sensitivity and to animal

appetites. Nothing is more foreign to Vanini's thinking than a speculative and contemplative, pure and passionless, activity. If the human mind were of divine origin – he writes – it should always think in terms of divine or at least human truths (“Si divina mens nostra est [...] divina semper vel humana saltem vera cogitaret,” *De adm.*, p. 491). On the contrary, according to Vanini, human rationality is concrete and follows the same procedures and techniques of argumentation and reasoning which in turn require material tools (“Materialia instrumenta ad ratiocinandum requiruntur,” *De adm.*, p. 382). In order to avoid escaping towards metaphysics, Vanini states that rationality is inherent in the materiality of the body and in continuity with the animal instinct. Overturning the Stoic philosophy, which draws a sharp demarcation line between humans and animals, he brings back reason to instinct. What in us is called “reason” – he writes – coincides in animals with what we call “natural instinct” (“Quod in nobis vocatur ratio, in brutis naturae instinctus a nobis dicitur,” *De adm.*, p. 343). In other words, *ratio* belongs to the scope of natural and animal reality. Whereas instinct guides animal life, reason guides human life. The only difference is that the former determines in brutes a univocal and repetitive behavior, while the latter gives humans a wider range of choices. But in both cases, these are behaviors which related solely to the environment, purely physical for animals and physical and cultural for humans.

Being natural, human rationality belongs to the time, because it is part of nature's becoming; the eternal and absolute truths are precluded from it. Vanini rejects the Aristotelian concept of duality of the intellect, active and passive. Human knowledge does not depend on an intellect that intuitively grasps the intelligibles, but it depends on direct contact with the contingent order of nature. The intellectual intuition of the eternal essences is rejected because it does not have any impact on scientific knowledge. Scientific truths are for Vanini hard to conquer, because our theoretical faculties are discursive and marked by subjective components such as *assensus* or *dis-sensus*, *credulitas*, *fides*, and *consuetudines*.

Consequently, the *scientia Dei* is rejected, which, on the one hand, may not have access to the *varietas* of the natural world and, on the other, cannot be the cause of things, because in either case, it is incompatible with natural becoming. If the divine mind knew individual, changing, and contingent things, it would, like the human mind, be subject to change and error, and vice versa, if it had no knowledge of them, divine wisdom and divine power would suffer a restriction incompatible with the nature of divinity.

The logical principle, of Aristotelian derivation, from which Vanini moves, is that the nature of science depends on that of known objects. The object of science – he observes on the basis of Aristotelian *posterioristics* – cannot be of a different nature from that of the cognitive faculty. You cannot have any certain knowledge of what is inherently uncertain. Vanini uses this principle to draw a sort of demarcation line between divine science and human science. Theology has done nothing other than transfer into the divine mind the intelligible essences of Aristotelian origin. Divine science is certain because it relates to necessary and universal essences but has as its counterpart the impossibility to incorporate as its own objects the individual and particular entities that are subject to becoming and changing. Not surprisingly Aristotle had said that if God were aware of those, He would be degraded. With a hint of radicalism, Vanini infers that God does not have knowledge of all things; but rather of the individuals. He does not even have the knowledge of them, which brutes have (*Amph.*, p. 243).

Demolished theology, also the epistemic ideal of Aristotelianism that has its foundation in the science of the universal collapses. What is the use – Vanini notes – of knowing that Socrates, Plato, and Aristotle are “men” if you ignore the specific individuality whereby each one differs from the other? Essentialist metaphysics is inadequate for building scientific knowledge. The parameters of science should be redefined starting from the real conditions in which human knowledge is produced. For Vanini our intellectual faculty is operational and is constantly moving and constantly becoming something else, like all other natural beings. This means that his gnosiology is

shaped in the subjectivistic sense: our intellect is not concerned with eternal truths that precede experience; we – writes the philosopher – are circumscribed within the limits of time and space; our knowledge changes with the changing of things; it does not have the stability of divine knowledge but moves from agreement to dissent, from truth to error or vice versa.

Vanini does not push his analysis to the limits of phenomenalism or, even worse, skepticism. Unlike the libertines, he is confident in science. The human intellect is indeed caught within the meshes of time, but it is also a conjectural and operational faculty, which, acting on the material provided by the senses, increases its knowledge indefinitely, just as in the process of indoctrination (*Amph.*, pp. 138, 253), which produces organic accumulations of knowledge. But the basic problem is to determine what are the conditions for the certainty of human knowledge. And in this respect, he has in mind a change in the epistemological model of science, no longer anchored to the needs of universal essences, but to the necessity inherent in the causal relationship. The size of certainty in human knowledge is not precluded because natural order coincides with the causal chain that links events and things. The conjectural faculty is to predict the possible effects of present or past causes. In short, the necessity inherent to causal connection is a guarantee of order and knowability of the things and therefore also of the certainty of human knowledge (*Amph.*, p. 131). In the light of this change in perspective, the continued insistence of the Salentino on the natural causes that take away from things or events the enamel of *arcanum* and of *admirandum* is explained. Removed from divine nature, causality, as a necessary and intrinsic connection to things, is lowered into the physical world; it is indeed a kind of its internal law or rule on which the certainty of human knowledge is based. The natural world is no longer subject to the whim, to the will, or to the power of an external agent, but it is a self-sufficient order, governed by its own principles.

Unfortunately, Vanini takes a step towards the foundation of modern science only in view of a purely theoretical frame, from which mathematics

is absent which, however, constitutes its main tool. He is even less equipped at the level of experimental research, because his concept of experience is mostly equivalent to mere empirical observation. It follows that he conducts the identification of proximate causes with a good dose of approximation. This means that his scientific research remains in many ways conjectural; most of his results are fleeting and often, in the absence of accurate identification of proximate causes, he is lost in a farraginous jumble of assumptions sometimes inadequate, sometimes even elementary and simplistic, sometimes perhaps excessively influenced by irreverent or subversive purposes. The exceptions are some brilliant insights in the field of biology which some scholars considered forerunners of Darwinism and which perhaps would fit more appropriately within the frame of a naive or primeval biological transformationism.

Politics and the Unmasking of Power. Secularized Ethics

The common thread of Vanini's political thought is given by a Machiavellism widely contaminated by the theory of imposture derived from Lucian and by a strong challenge to the power of the courts of Aretinian origin. Therefore, in the hands of the Salentino, Machiavellianism is translated into a kind of useful tool to unmask the connection between religious power and political power. The task of the philosopher is to denounce the absolute arbitrariness of both; indeed, it is, more precisely, to reveal the intimate intertwining whereby the former appears to be the ideological support of the latter, both of which are based on a system of lies that affect civil and intellectual liberties which are vital for the free expression of art and science.

This explains the subversive nature of Vanini's thought, who is obviously not interested in safeguarding or preserving the political-social order, but rather in its demolition through the demolition of the *Leges*. If the *libertins érudits* are aligned up on the ideological positions of the conservative bourgeoisie and if the libertinism of

the poets that move in the *entourage* of Théophile de Viau feeds on the rebellion of the aristocratic classes and trespasses into forms of wickedness and unbelief mostly gratuitous and without theoretical consistency, Vanini theorizes a law of nature, which has a double meaning, ethical and political, and is alternative to religion and to historical-positive law.

Everything that moves away from the law of nature is arbitrary and is violence perpetrated on men. The unmasking of power passes through a close confrontation between the divine government and the human government, which are mirror images of each other, and both arbitrary. The emphasis is often on the theme of revenge. Both divine justice and human justice appear more like revenge than fairness. The God of the Sacred Code (note the substitution of religious with legal terminology) is the avenger of crimes; the earthly judges are his ministers. Since he derives his power from a divine origin, the sovereign legitimates his own power to administer justice. The punitive actions of the earthly prince have an immediate effect, those of divine justice postpone rewards and punishments to a fictional future life so that political-religious deception is not easily exposed (“ne fraus detegi possit,” *De adm.*, p. 366) and helps perpetuate the status of slavery and psychological subjection of the people (*Amph.*, pp. 82–83, 85–86; *De adm.*, p. 366).

Removing from the power of the prince the material and spiritual foundation means for Vanini revealing its arbitrary nature. All power, whether divine or earthly, is arbitrary, not bound by any law, because the law is nothing more than the will of God or of the earthly prince itself. This means that any power, divine or human, everything is permissible: if God makes us all sinners, he does not act in violation of any rule, simply because he acts in accordance with his will (*Amph.*, p. 103). The same applies to the earthly prince. But if power is arbitrary, it means that it is no longer of divine origin and is therefore questionable. What prevents people from rebelling is not the fear of divine punishment, but that of a violent and persecutory reaction from the prince. The

philosophers themselves had to bow their heads and take refuge in silence, spurred by the fear of public power. The example of Socrates was a warning to all. Aristotle left Athens to prevent a new crime against philosophy from being committed. The free expression of ideas is always opposed by the religious power; the books by Protagoras were burned in the public square, in a climate of intolerance not unlike that of the age of the Counter-Reformation (*De adm.*, 1616, p. 367; *Amph.*, p. 90).

Political power as much as religious power is based on cunning, fiction, and on deception. Not even Christianity is free from them. The figure of Christ is drawn by Vanini according to the parameters of the fox-like cunning of Machiavellian mold: pretending to preserve or to complete the Jewish religion, Christ subverts its foundations and establishes in its place the Christian religion. Then, to protect it from the risk of inevitable corruption, he starts circulating the prophecy of the Antichrist. The new prophet, that is, behaves in the same way as a new prince: to consolidate his power, which in the initial phase is weaker, he uses cunning or weapons. Christ chose to found the Christian law, exposing and sacrificing himself to an ignominious death, so that his example was not attractive to other self-proclaimed Messiahs; Moses always carried weapons and sowed carnages and blood in his path. The religions, Mosaic and Christian, had a long life because of their link with the dominant power; Apollonius of Tyana founded a short-lived religion because he preached poverty and came into conflict with vested interests (*De adm.*, pp. 357–359, 454).

But it is not enough to denounce that religions are based from the outset on deception and lies. The objective of Vanini is to emphasize that they also exert psychological tyranny. Deception – he notes – in order to be lasting must affect basic human needs and must relate to hopes and fears: only these exert a psychological, intellectual, and social tyranny over believers. This explains, therefore, how the action of the prince or of the prophet on the people is one of seduction and plagiarism (*De adm.*, 1616, p. 453). The

stratagem which they commonly use is to make people believe they have a direct and privileged relationship with divinity, so that the opposition to their power is immediately perceived as a violation of divine will. All acts of the prophet are intended to reinforce this belief. Political domination and priestly power, to perpetuate themselves over time, are formed so as not to be susceptible to challenge. To perpetuate the religion which he founded, the new prophet seeks to exert a cultural domination that extends beyond his death. The stratagem of resurrection or ascending to heaven is functional to this. Moses threw himself into an abyss so that the people believed him resurrected. So did Empedocles and the prophet Elijah. And the implication, not even so veiled, is that Christ did the same to consolidate the newly born “Christian slavery” (*De adm.*, 1616, pp. 390, 361).

No positive religion, no historic civilization has an infinite lifespan: Vanini has a strong sense of the historicity of civil and religious institutions – cities, kingdoms, and religions are subject to the iron law of natural becoming. He tends to place a strong emphasis on the natural law of generation and corruption of all things: “*Omnia orta occidunt*” – all that is born is bound to perish. Nothing lasts forever – values, customs, traditions, ways of thinking, beliefs, ethical rules, and civic and religious organizations – everything is swept away by the law of becoming. What was holier and nobler than the name of *Jupiter* according to the faith of the Gentiles? And what is the meaner and more execrable than this in the Christian faith? Kingdoms and religions are historical products: they are born, they grow, they reach the peak of their vitality, but then they begin their inexorable process of senescence and exhaustion. In the birth phase of the new religion, miracles abound, because the prophet wants to appear as the son of God or as an envoy, and then decrease steadily until they disappear altogether. Finally, a religion replaces another. And since the world is eternal, rituals periodically return: the ones currently in force have been activated thousands of times and will come into force again, not according to the individual, but

according to the species, i.e., not in the form of their individuality, but in that of their specific essence (*De adm.*, pp. 386–389).

Radical and de-theologized is also Vanini’s ethics, which has a strong naturalistic inclination almost flattened in a medical-scientific or physiological investigation of human passions and affections, traced mostly to a mechanistic motion of the vital spirits. The most relevant data is that it is ethics autonomous from the metaphysical considerations, either from theological assumptions or religious evaluations. As in political thinking, the parameter of an ideal State is absent, in ethical thinking are the dimensions of the absolute absent. Moral behavior is seen only from a relativistic viewpoint in relation to the composite structure of the subject agent. Of course, it is unprejudiced ethics in the dual sense that it is free from conditioning prejudices and unrelated to morals, and it is also an effort, a propensity, and a fight against any free prejudices that mortify natural human life. It is therefore primarily ethics liberated and emancipated from the connotation of sin, full of epicurean traits, strongly aimed at the evaluation of the pleasure.

In Vanini’s ethical reflection, sexual pleasure plays a central role, not least because it is what presides and ensures the perpetuation of the species. Life on earth would run the risk of becoming extinct if nature had not endowed us with the coupling instinct. Therefore, sexuality is freed from any negative connotation: sexual organs do not deserve the name *pudenda*, because they are authors and masters of reproduction: “procreationis magistrae [...] et opifices” (*De adm.*, p. 311). The Dialogue XLVIII is a full and radical reevaluation of sexual pleasure, proposed as a sixth sense and a very sweet thing (“res dulcissima”) because it is a function of reproduction. Vanini’s ethical hedonism is far from taking spiritualistic veins: pleasure is not viewed as an affection of the soul, but of the compound, i.e., of the *synolon*, understood in line with Aristotelianism as a union of soul and body. Pleasure, therefore, cannot but have a bodily and material component.

This means that *felicitas* consists neither in the Averroistic copulation nor in a vision-contemplation of transcendent deity, it is rather an all-earthly *felicitas* which Vanini with caution projects in the rarefied celestial sphere of a *Respublica* in a sort of social-political, reversed *utopia*, where the negative values of the existing social model are overturned: "A Republic in which participation is without envy... all men want others to partake in what is there... because he who wants, wants others to want the same things and makes sure that we also want what he wants" (*Amph.*, p. 196).

And it is precisely on the subject of happiness or bliss, understood as the enjoyment of the highest good, that the claims of ethics of religious origin collapse. Vanini, in fact, insists on the impossibility of unification of finite and infinite. Only the infinite God can identify with himself as the infinite being. So only God can be blessed. Even more radical is the observation that the act can have an aim provided that the aim does not exceed the power of the operator. In other words, the purpose generally cannot exceed the material conditions of the actor. As the coach, which is the final term of the operation, does not exceed the potentialities of the carpenter, the aim of the will cannot transcend its potentialities. The human will does not immediately want the highest good, because it is taken with the desire of being. So if good is the being, our will desires the being, not because is devoid of it, but because it possesses it. We do not desire the being which we already are, but we want its preservation. Having embarked on this path, there is no supernatural finality. In fact, we do not desire God's being, because those who desire, desire their own perfection. If we wanted God's being, we would want our corruption and our destruction (*Amph.*, pp. 189–196).

Varchi, Benedetto

Born: Florence, 19 March 1503

Died: Florence, 19 December 1565

Dario Brancato

Department of Classics, Modern Languages and Linguistics, Concordia University, Montreal, QC, Canada

Abstract

Benedetto Varchi was one of the most versatile intellectuals of the sixteenth century, who offered highly innovative and original answers to the cultural challenges of his time. He devised a new theory of language that anticipated modern sociolinguistics and put the vernacular at the forefront of the philosophical and literary developments of his time. In turn, he renewed the scope of philosophy through a language that was conceptually accurate and stylistically pleasant and applied his theory to his translations of classical authors and his linguistic dialogue *L'Hercolano*. Varchi lectured extensively on the ancient classics, as well as Dante and Petrarch; he is the author of a major history of Florence commissioned by Cosimo de' Medici.

Biography

Benedetto Varchi was born in Florence on March 19, 1503. His father was Ser Giovanni, a notary from Montevarchi (Busini 2008, pp. 92–93; Lo Re 2008, pp. 295–296); his mother was Diamante, widow of painter Benedetto del Ghirlandaio (Valori 2008, p. 117). After completing a Law degree at the University of Pisa (Ferrone 2003, p. 9), Varchi devoted himself to the study of philosophy and literature, and attended, at a very young age, meetings at the “Orti Oricellari” (Lo Re 2008, p. 295). His first mentors were Francesco Verino “Primo” and Piero Vettori (Pirotti 1971, pp. 10–11; Lo Re 2008, p. 30). Varchi’s republican sympathies forced him to

flee Florence after Cosimo de’ Medici succeeded Duke Alessandro (January 1537): he followed Roberto Strozzi, who was the son of Filippo Strozzi, a prominent banker, and leader of Florentine expatriates, first to Venice then to Padua, serving as a tutor for Roberto’s younger brothers (Pirotti 1971, pp. 13–15). Varchi remained in Padua even after his relationship with the Strozzi soured and began to gravitate around a group of intellectuals linked to the University of Padua (Vasoli 2007, pp. 405–506). He was among the founders of the Paduan Accademia degli Infiammati, where he delivered several lectures on Greek and Latin classical authors (Theocritus, Horace, Tibullus), Petrarch, and contemporaries such as Pietro Bembo or Giovanni Della Casa (Lo Re 2008, pp. 191–256; Andreoni 2012, pp. 43–63). Varchi’s most ambitious endeavor at the Infiammati was the project (never completed) of translating and commenting on Aristotle: he lectured on the *Nicomachean ethics* and wrote vernacular commentaries on *Ethics* and *Prior analytics* (Lo Re 2008, pp. 216–229; Brancato 2018a). In 1541, Varchi moved to Bologna and attended the lectures of Ludovico Boccadiferro, who taught philosophy at the University (Rotondò 1969; Lo Re 2008, pp. 242–243). Meanwhile, Cosimo de’ Medici, in recognition of Varchi’s rising reputation, invited him back to Florence to become a member of the newly established Accademia Fiorentina. Thus after a brief sojourn in Ferrara, Varchi was pardoned and allowed to return to his hometown in 1543 (Pirotti 1971, p. 20; Firpo 1997, pp. 264–266; Lo Re 2008, pp. 287–295).

Back in Florence, Varchi continued his work on Aristotle and drafted a commentary on the *Meteorologics*, a text he might have studied with Boccadiferro (Gilson 2016); he was also appointed to lecture on Petrarch at the Accademia Fiorentina, where he defended Bembo’s linguistic theories and offered philosophical readings of Italian authors (Andreoni 2012, pp. 15–20). He was the first, for instance, to emphasize the Aristotelian content of Dante’s *Divine Comedy* (Andreoni 2012, pp. 98–106). Varchi’s innovative ideas and methodology entered into conflict with those of other academicians, especially Carlo

Lenzoni, Pierfrancesco Giambullari, and Cosimo Bartoli (Plaisance 2004 [1974], pp. 129–148; Firpo 1997, pp. 179–191, 268–270; Lo Re 2008, pp. 302–319). The rivalry between Varchi and these intellectuals was not limited to academic tensions: in 1545, the year Varchi was appointed consul at the Accademia Fiorentina, Lenzoni wrongly accused him of sexually assaulting a young girl. Varchi was once again pardoned by Cosimo thanks to Bembo's help, but had to accept the charges and pay a fine to save the real perpetrator of the rape (Lo Re 2008, pp. 332–336; Lo Re 2010). During his consulship, Varchi gave several lectures on Dante but his workload as an academician decreased when Cosimo and his wife, Eleonora di Toledo, requested him to translate Boethius' *Consolation of Philosophy* (1549; published 1551), and Seneca's *On benefits* (1548; published 1554). Above all, at the end of 1546, Varchi was appointed as the official historian of the Duchy of Florence and was commissioned to write a history that would originally cover the final years of the last Florentine Republic (1527–1532); the work was eventually expanded to include events up to 1538 (Bramanti 2017, p. 147, 190). Varchi spent the last years of his life working on several other projects, the most important of which is *L'Hercolano* (printed posthumously in 1570), a dialogue on language that discusses sixteenth-century debates on the *questione della lingua* and offers an original contribution. Varchi died a few hours after suffering a stroke, on December 19, 1565, leaving most of his works incomplete or unpublished (Brancato 2017, p. 55).

Heritage and Rupture with the Tradition

Very little is known of Varchi's early philosophical education: We know that he studied logic with Verino; the only surviving works by this philosopher, three lectures on Dante, emphasize the "concordia" among Plato and Aristotle (Vasoli 2007, pp. 403–404). Many Platonic themes in Varchi's lectures, such as that of love, may as well come from Francesco Cattani da Diacceto, an author Varchi knew well (Vasoli 2007,

pp. 404–405); as a child, Varchi lived in the house next to Diacceto's (Valori 2008, p. 117); in 1559, Varchi even wrote his biography, published in 1561 (Del Soldato 2013). The years in Padua were crucial to Varchi's intellectual formation: in particular, his belief that the vernacular could replace Latin as the language of philosophy, an idea that was shared by some members of the *Infiammati*, determined at least in part his subsequent views on philosophy and language (Andreoni 2012, pp. 42–53; Siekiera 2013). Varchi was certainly influenced by his fellow academician Sperone Speroni. A student of Pietro Pomponazzi, Speroni borrowed from his mentor the idea that vernacular languages were perfectly apt to convey any philosophical truth; that Latin's alleged superiority was based on false premises, given that incorrect Latin translations were the direct cause for misinterpreting ancient philosophy; and that accurate translations would enable every citizen of the world to access and practice philosophy (Fournel 1990, pp. 115–151; Vasoli 2007, pp. 406–408). Varchi's position was different, however, in that, first, he did not reject the medieval Latin tradition altogether. For example, in his vernacular translation of *Prior analytics*, he deliberately chose to italianize Boethius' Latin lexicon rather than rely on Cicero's vocabulary (Brancato 2018a, pp. 112–115). Evidence also indicates that Varchi readily used Latin, particularly in contexts in which it was easier to do philosophy in Latin rather than in the vernacular. Thus when he gave public lectures on *Ethics* in Padua, he readily switched from Italian to Latin when his audience, which included students, complained that they could not understand the Italian vernacular (Lo Re 2008, pp. 218–224); he also chose Latin to write a short exposition on the three figures of syllogism that he used as preparatory material for his vernacular commentary on *Prior analytics* (Brancato 2018a, pp. 107–109). Secondly, and most importantly, Varchi's ideas on the role of the vernacular were markedly different from those of Pomponazzi and Speroni. Pomponazzi and Speroni, who came from Northern Italy, considered that philosophy should be expressed by using any "natural," spoken vernacular language, which excluded the literary

language of Dante and Petrarch based on Tuscan. In contrast, for Varchi and other *Infiammati* philosophers such as Alessandro Piccolomini, whose native tongue was Tuscan, this distinction between literary and natural/spoken vernacular was much more blurred (Siekiera 2007, p. 6; Cotugno 2014). It is during the same period in Padua that Varchi developed his theory on language and explored ways to put this theory into practice. For instance, he wrote comparative grammars of Latin, Greek, Hebrew, and Tuscan with a view to testing the capacity of the vernacular to reproduce the grammatical structures of ancient languages (Sorella 2007, pp. 17–41; Siekiera 2013, p. 151). As we shall see, these investigations eventually constituted the theoretical underpinning for his *Hercolano*.

As far as Varchi's philosophical ideas are concerned, the figure who had the greatest impact was Lodovico Boccadiferro. A very charismatic mentor, Boccadiferro offered an interpretation of Aristotle that combined a strong attachment to traditional scholastic Latin authors with a clear interest in the recent advances of humanism. Boccadiferro's lectures were characterized by a critical attitude towards all *auctoritates* (whether ancient or modern) and an openness towards the newly revived Greek commentators as well as Plato (Bianchi 2004, pp. 363–370). In that respect, Boccadiferro provided Varchi with an Aristotelian interpretative framework that was sufficiently flexible and versatile to be adapted to his lectures on Dante and Petrarch at the Accademia Fiorentina (Andreoni 2012, pp. 98–99).

Innovative and Original Aspects

Varchi's intellectual path was not linear: He was exposed to different cultural environments (ranging from informal meetings to public events, from academies to universities) and various disciplines (natural philosophy, logic, ethics, medicine, literature). This might give the modern reader the impression that he was an eclectic and unoriginal thinker. In fact, Varchi was particularly receptive to the cultural changes he witnessed and

offered highly innovative responses to these changes, which were motivated by the belief that philosophy as a whole had to undergo a radical renewal through the creation of a new language and a new method of learning (Andreoni 2012, pp. 187–188). This explains, for example, his investigations on method and the organization of knowledge, the reassessment of literary genres and the creation of a vernacular literary canon, or the particular place given to logic in the creation of a vernacular language that was suitable for philosophy (Andreoni 2017, p. 7; Siekiera 2013). As we have seen, for Varchi, the new philosophical language should be closely connected to the Italian literary tradition, a position that clashed with the opinion of philosophers such as Pomponazzi, because it gave the Tuscan language pride of place. Over the course of his career, Varchi developed and refined a theory that in many ways anticipated modern-day sociolinguists' concept of "class variation" (Ward 1991). In the *Hercolano*, Varchi compared classical and modern idioms and developed a new classification of languages in which the vernacular spoken by the upper classes of Florence is described as the most suitable language to express philosophy and the only language that naturally resembles the literary language. Varchi's theoretical model followed that of Pietro Bembo in that it was based on the works of Petrarch and Boccaccio, but it also differed from it: it was also open to other authors censored by Bembo, such as Dante; and, in contrast to Bembo's theory, it integrated idioms and syntactical structures taken from the spoken language (Sorella 1995, pp. 48–70; Marazzini 1999, pp. 77–86). Varchi's theory was refined over the years, but an early practical application of this model can be appreciated in his translations, in particular that of Boethius' *Consolation*, in which one can find almost verbatim quotations from Petrarch along with typically Florentine idiomatic expressions (Brancato 2018b, pp. 74–84).

Varchi's strife for a renovation of philosophy is also reflected in his sustained interest in the new intellectual trends of his time, which he actively sought to appropriate in his own work. He was particularly attentive to the new scientific

advances of his time, such as Ramus' discussion on method (Vasoli 2007, pp. 422–427) or Andrea Vesalius' use of anatomy (Andreoni 2012, pp., 106–110). More interestingly, Varchi did not hesitate to use first-hand material (such as contemporary testimonies or interviews) when secondary literature on a specific subject lacked. This was the case for his two lectures on the arts (*Due lezioni* 1550), especially the second one, on the comparison between painting and sculpture. Rather than drawing on existing written sources, Varchi asked a number of artists (including Michelangelo) to express their opinion on the respective merits of the two artistic forms and published their responses (Mendelsohn 1982; Quiviger 1987; Collareta 2007). Similarly, in the *History of Florence*, when recounting the assassination of Duke Alessandro (1537), Varchi included data taken from an interview with Scoronconcolo, one of the two murderers (Bramanti 2017, pp. 187–188).

Impact and Legacy

Upon his untimely death, Varchi's library was dispersed, a significant part of his correspondence was lost, and many of his works remained unpublished until the nineteenth century (Bramanti 2008, pp. xi–xv). His *Storia fiorentina* was immediately condemned after publication on account of its suspected immorality and inconvenient political content (Brancato and Lo Re 2016, pp. 223–224). In the twentieth century, his work was often dismissed as derivative and of poor literary quality; Guido Manacorda (1903) went as far as presenting Varchi as a debauched and sexually devious character, whereas Carlo Dionisotti (1980, pp. 427–433) viewed him as an intellectually dishonest courtesan (Lo Re 2008, pp. 13–39). More recent studies, however, have done much to recognize the centrality of Varchi's works in sixteenth-century Italian culture, although many of his writings are still awaiting detailed study and/or critical edition.

The versatile character of his work and his ability to answer the cultural challenges of his

time in a highly innovative and indeed original way make him one of the most interesting figures of the sixteenth century. Varchi's work is particularly significant in the history of Renaissance literary criticism. His academic lectures on Petrarch and Dante, even if they remained for the most part unpublished until the nineteenth century, circulated widely among his contemporaries and in the following centuries. In his lectures, Varchi is one of the very first authors to combine the insight of Horace's literary criticism with the recently rediscovered Aristotle's *Poetics*; he is also original in his comparative approach to Dante and Petrarch, paying particular attention (something that was highly unusual at that time) to the rhetorical, linguistic, and grammatical aspects of their texts. He is notable for having applied the humanistic philological tools to Dante and his method of collating several manuscripts of the *Comedy* formed the basis of modern Dante philology (Andreoni 2017, p. 4).

Varchi's innovative ideas were in conflict with the conservative cultural environment of Florence. His lectures on Dante, especially those where he defined Dante as a truly Aristotelian philosopher, were often criticized and derided by his fellow academicians. His defense of Bembo's ideas was openly rejected by Lenzoni, Giambullari, and Bartoli. Despite being marginalized in Florence, however, Varchi was at the center of a wide intellectual network that allowed many of his ideas to thrive and survive. He also had many pupils whom he involved in the production of his works and in the activities of the Accademia (Brancato 2018a, pp. 115–116). It is also thanks to Varchi's original adaptation of Bembo's ideas (adding to Bembo's classicism a strong attention to the grammar of the spoken language) that the *Prose della volgar lingua* became the linguistic model for standard Italian language: The canon of vernacular authors that Lionardo Salviati (who happened to be Varchi's pupil) used for the first Italian dictionary (*Vocabolario della Crusca* 1612) was precisely modeled on Varchi's linguistic theory (Marazzini 1999, pp. 86–87, 90–93).

Vasari, Giorgio

Born: 30 July 1511, Arezzo

Died: 27 June 1574, Florence

Eliana Carrara

University of Molise, Campobasso, Italy

Abstract

Giorgio Vasari, painter and architect from Arezzo, who obtained many important commissions during his long artistic career (1532–1574), is the author of the *Lives*, published in Florence in 1550 (Vasari 1550) and reedited in 1568 (Vasari 1568b).

The text is the first example of modern artistic literature: after analyzing the three arts (architecture, sculpture, and painting), Vasari traces the biographical profile of the artists from the Middle Ages to his era and focuses on their works.

Cited, imitated, translated, the *Lives* represented a model of artistic historiography for at least two centuries and still remain an

essential source for the documentation and information provided as well as for the careful reading of the works of art.

The role of Vasari as a man of letters, and also as an important artist, is already clear in the letter that he sent to Benedetto Varchi during the survey launched by the latter in 1547 (and published in Florence by Lorenzo Torrentino in January 1550 with the title *Due lezioni di M. Benedetto Varchi, nella prima delle quali si dichiara un sonetto di M. Michelagnolo Buonarroti. Nella seconda si disputa quale sia più nobile arte, la scultura o la pittura, con una lettera d'esso Michelagnolo, et più altri eccellentissimi pittori et scultori, sopra la quistione sopradetta*).

Introduction

Giorgio Vasari, painter and architect from Arezzo, is the author of the *Lives*, published in Florence in 1550 and then reedited in 1568.

The *Lives* is the first example of modern art literature: after a general introduction of the three arts (architecture, sculpture, and painting), Vasari traces the biographical profiles of artists from the Middle Ages up to his own time and analyzes their works. In his opinion, the revival of the arts begins only with Cimabue and Giotto; as he explains in the preface to the *Lives*, art slowly rose to the height of perfection in antiquity and then decreased gradually from the time of Constantine onwards and later was completely destroyed after the invasions of the barbarians, the Goths.

Vasari subdivides the history of art into three phases (and a specific *Part* of the *Lives* corresponds to each one of them) on the basis of an anthropomorphic model, such as a representation of childhood, youth, and maturity; Vasari based his division of history into epochs on a biological concept of history known since antiquity and present in authors such as Polybius (but also attested in Machiavelli): the comparison between the age of a human being and the development of a State (Mattioda 2007).

After the first phase (*primi lumi*), a period of growth and improvement followed (*augumento*),

and finally the third epoch arrived, which extended up to Vasari's time, the time of perfection (*perfezione*), reached by Michelangelo. In the first (whose greatest exponent is Giotto), artists had begun to imitate the colors and forms of nature, the three-dimensional appearance of the figure, and the expressiveness of the living human body. In the second, datable from ca. 1400 to ca. 1500 (Masaccio was its main exponent), artists had dedicated themselves to a long series of experiments, especially in perspective and anatomy, leading art to the ability to record the real world almost completely, although with an artistic expressiveness still stiff or imposed by the rules. Only in the third period, which included the *Lives* of Leonardo, Raphael, and Michelangelo, artists not only showed mastery of nature, but triumphed over it. Vasari did not invent the idea of the process of perfection of art through its greater similarity with nature; it was also known in ancient literature, for example, in a passage of Cicero's *Brutus* that Vasari quoted almost word for word (Gombrich 1960). He applied this model to the art of his age and also used it as a means of classifying the art of the past: so the artists of earlier times could be judged and ranked according to their proximity to his ideal, the *perfetta regola dell'arte* (perfect rule of art). In the third preface (which introduces the third part of the *Lives*), Vasari defines the *perfetta regola dell'arte* as the practice of five precepts in art, that is, *regola* (rule), *ordine* (order), *misura* (measure), *disegno* (drawing), *maniera* (style), this later one especially when it becomes *bella maniera* (beautiful style). By borrowing the concepts of *regola*, *ordine*, and *misura* from the theory of architecture, he applied them also to the other arts. Art attained perfection in the third epoch – says Vasari – thanks to the contemporary discovery of ancient statues, which allowed artists to overcome the rules imposed by study and artistic discipline with some freedom (*licenzia*) that was not, however, arbitrary, but regulated by the judgment of the eye, the supreme authority (De Girolami Cheney 2005).

Together with the *perfetta regola dell'arte*, Vasari, as he explains in the second preface, introduces another norm, the *qualità de' tempi* (the

peculiarity of time). That means that the art of earlier times, which could only be described as imperfect when judged by contemporary criteria, could, however, be praised. In this way, Vasari established the general principle of his historiography, which was to evaluate time, place, circumstances, and people in judging historical facts. The *Lives* is much more than a chronological sequence of biographies (a literary genre that already existed): it is the first critical history of style in the arts (i.e., architecture, painting, and sculpture) (Sohm 2000).

The *Lives* is, in fact, based on the humanistic concept that history can instruct and encourage through remembering the most important men and their careers and achievements.

Vasari's book is an important document of the cultural world in sixteenth-century Italy and well attests that an artist has been able to master the cultured instrumentation hitherto the preserve of the high social classes in order to draft the first systematic treatise of art history.

In the sixteenth century, its value had been recognized by writers of art such as Raffaello Borghini (author of *Il Riposo*) and Francesco Bocchi (and again in the seventeenth century by Giovanni Baglione and Filippo Baldinucci), but had also become the subject of strong criticism: already in 1557, Lodovico Dolce wrote the dialogue entitled the *Aretino*, where he argues vigorously against Vasari's text and asserts the superiority of Titian even over Michelangelo. Strong allegations of partisanship in favor of the Tuscan artists were repeated in the seventeenth century by Marco Boschini (*La Carta del navigar pitoresco*) and Carlo Cesare Malvasia (Sohm 1995, 2001; Cropper 2013).

The large number of marginal notes in copies of the *Lives* (Ruffini 2009), written in their own hand by artists such as Federico Zuccaro, Annibale Carracci, Francisco de Holanda, and El Greco, or by *connoisseurs*, such as Sebastiano Resta, testifies to the interest with which Vasari's work was read and the controversies that followed (Spagnolo 2007).

The numerous histories of art modeled on Vasari's book, as well as the new editions of the *Lives* in the seventeenth and eighteenth centuries,

are the clearest evidence of the impact that the work has had on European culture: from the Netherlands (Karel van Mander, *Schilder-boeck*, 1603–1604) to Spain (Francisco Pacheco, *Arte de la pintura*, 1649) and Germany (Joachim von Sandrart, *Teutsche Academie*, 1675).

Cited, imitated, and translated, the *Lives* has represented a historiographical model for at least two centuries and still today remains an essential source for the documentation and information provided as well as for the careful reading of artworks.

Biography

Vasari was born in Arezzo, the son of Antonio Vasari (d. 1527) and Maddalena Tacci (d. 1558). His family came from Cortona, where his great-grandfather, Lazzaro di Nicolò de' Taldi, was a craftsman of saddles and painted scenes: one of his four children, Giorgio, was a potter (in Italian “vasaio”); Giorgio Vasari, his nephew, inherited his name and patronymic. As claimed by Vasari in the *Life of Luca da Cortona* (but only in the second edition published in 1568 by Giunti in Florence), the painter was his relative, because the father of Luca, Egidio, had married Lazzaro Vasari's sister.

Vasari studied Latin and the humanities in the late 1510s under Antonio da Saccone and Giovanni Lappoli (called il Pollastra, 1465–1540). He also became a pupil of Guillaume de Marcillat, a French master glassmaker at that time working in Arezzo, where he ended his life (1529), and in 1524 Cardinal Silvio Passerini of Cortona, a man of the court of Pope Clement VII, introduced Vasari to the circle of the Medici family in Florence. While he was living in the house of Niccolò Vespucci, he received further instruction from the teacher of Alessandro and Ippolito de' Medici, Pierio Valeriano (1477–1558), and he met Michelangelo Buonarroti and attended the workshops of Andrea del Sarto, Vittorio Ghiberti, and Baccio Bandinelli, who taught him draughtsmanship very well. After the expulsion of the Medici in 1527 and because of the spread of the plague (which reaped among its victims

Vasari's father), the young artist was called back home by his uncle Antonio to Arezzo, where he became familiar with the teachings of Rosso Fiorentino, who took refuge in the countryside to escape the epidemic. Vasari arrived in Rome in 1532 as a member of the retinue of Cardinal Ippolito de' Medici (d. 1535): together with Francesco Salviati, he devoted himself to the study and making drawings of antiquities and works of art kept in the *Urbe*. After his return to Florence, Vasari was benevolently received by Ottaviano de' Medici and then entered the service of Duke Alessandro (his portrait now in the Uffizi is by the young painter) until his death, killed by his own cousin, Lorenzo de' Medici (January 6, 1537) (Plaisance 2013). Shocked and stricken by the assassination and disgusted by court life, Vasari took refuge in Camaldoli, thanks to the good offices of the Aretine scholar Giovanni Lappoli (il Pollastra, his former teacher), and Don Miniato Pitti, with whom he had been familiar since his stay in Pisa in 1529, when the Olivetan monk was in charge as abbot at the monastery of St. Jerome in Agnano Pisano. Thanks to the Olivetan patronage, Vasari got assignments that took him to other monasteries and Italian cities: he was in Bologna, at S. Michele in Bosco, in 1539; in Naples, at S. Anna dei Lombardi or Monteoliveto, in 1544–45; in Rimini and Ravenna in 1547–48; and in Arezzo in 1548 (where he painted the *Wedding Banquet of Esther and Ahasuerus* for the Refectory of the Abbey of Saints Flora and Lucilla, now kept in the Medieval and Modern Gallery and Museum, in Arezzo) (Carrara 2006); in the meantime, he got to meet and work for people such as Pietro Aretino (who called him to Venice in 1541 to prepare and paint the scenic apparatus for his comedy, *La Talanta*); Bindo Altoviti, the wealthy Florentine banker living in exile in Rome; and Cardinal Alessandro Farnese, the nephew of Pope Paul III, who commissioned from him the *Allegory of Justice, Truth and the Vices* (the *Farnese Justice*, 1543, now in Naples), and the cycle of frescoes in the *Sala dei Cento Giorni* in the Palace of the Chancellery in Rome (1546) (Fenech Kroke 2011).

Vasari had already returned to Rome in 1538 to continue his training by drawing antiquities and

was called again to the *Urbe* in 1550 by Pope Julius III who appointed him to the building of his family chapel in S. Pietro in Montorio and, together with Bartolomeo Ammannati, of the nymphaeum of Villa Giulia. In 1554 Vasari moved to Florence to enter the service of Duke Cosimo de' Medici: he worked in Palazzo Vecchio and in Palazzo Pitti (Romby and Ferretti 2002, pp. 164–196) and built the Uffizi; he also restored numerous churches in the city (Sta. Maria Novella, Sta. Croce) and began the frescoes of the dome of Sta. Maria del Fiore, the Florentine Duomo (1574). He was also active in Arezzo (he restored the parish church of Sta. Maria, 1560–1564, where he erected also his tomb and built the Lodges of Piazza Grande, 1570–1572) and in Pisa (church and palace of the Knights of St. Stephen, 1562–1569). He returned again to Rome in 1571–1573, thanks to the commissions obtained from Pope Pius V for the decoration of three chapels in the Vatican (Aurigemma 2012).

In 1549 he married in Arezzo the young Nicolosa Bacci, who could not bear children. Vasari had already fathered, however, a daughter (and perhaps also a son) with Maddalena Bacci, his wife's sister, and then later had another son by Isabella Mora, his domestic servant (Lepri and Palesati 2003; Fubini Leuzzi 2015).

In 1563 he founded the Accademia delle Arti del Disegno, under the influence of Cosimo de' Medici, together with Vincenzo Borghini, the Prior of the Foundling Hospital (Ospedale degli Innocenti), and Lelio Torelli, first secretary of the Duke (Waźbiński 1987; Barzman 2000; Carrara 2008; Zangheri 2013).

His house in Arezzo (via XX settembre 55) is now a museum (Casa Vasari), while his home in Florence, which was a private residence for a long time, after a total restoration is visitable by appointment: both the palaces were decorated by Vasari with an ample cycle of frescoes (De Girolami Cheney 2006; Cecchi 2014). In the Aretine house are still kept some pieces of the precious collection of Vasari: a plaster statue of *Venus* by Bartolomeo Ammannati and a terracotta head of Emperor *Galba* by Andrea Sansovino, while the painting by Piero di Cosimo, *Venus*,

Mars, and Cupid, is in Berlin (Staatliche Museen) (Baldini 2014).

His famous *Libro de' disegni* (composed probably at least of seven volumes if not twelve) (Collobi Ragghianti 1974) is now disassembled, and many of its pages are housed in Paris (The Louvre) and in Florence (Gabinetto disegni e stampe degli Uffizi); some sheets are even in Oxford, Stockholm, and other collections. Vasari began to collect drawings during his apprenticeship (1528–29) with Vittorio Ghiberti, who gave him a group of sheets by Lorenzo Ghiberti and artists of the fourteenth century, maybe from Lorenzo's collection. He assembled with great care his drawings in the book, with marginal decorations along with its pages and portraits of the artists who had drawn them; unfortunately, where the characteristic Vasari mount has been removed from the drawings, as in the Uffizi, their provenance is seldom demonstrable. The dispersal of the Vasari collection began soon after his death: Francesco I de' Medici obtained a volume from Vasari's heirs; then some others were acquired by Niccolò Gaddi, the wealthy Florentine collector, and patron. In the seventeenth century, the volumes began to be broken up and the sheets were scattered all over (Forlani Tempesti 2014).

Works and Themes

The Paragone Debate and the Letter to Benedetto Varchi

In 1547 the philosopher and scholar Benedetto Varchi (1503–1565) launched a survey among the Florentine artists about the “maggioranza delle arti”, that is, a debate on the competition and rivalry among the arts: he collected the letters with their opinions, and in January 1550 he published them together with his own text on the question (*Due lezioni di M. Benedetto Varchi, nella prima delle quali si dichiara un sonetto di M. Michelagnolo Buonarroti. Nella seconda si disputa quale sia più nobile arte, la scultura o la pittura, con una lettera d'esso Michelagnolo, et più altri eccellentissimi pittori et scultori, sopra la quistione sopradetta*, Florence, Torrentino) (Bätschmann 2010; Andreoni 2012, pp. 16 and

20). Vasari, together with Agnolo Bronzino, Jacopo Pontormo, and Niccolò Pericoli, called Il Tribolo, Giovanni Battista del Tasso, Benvenuto Cellini, and Michelangelo, answered the call, and his letter, very well elaborated and refined, is – not coincidentally – the first in the Varchi book, while Michelangelo’s closes the list (Varchi and Borghini 1998, pp. 61–66 and 84): Vasari strongly affirms the superiority of painting over sculpture based on the increased capacity of imitation (“mimesis”) through the use of colors.

Vasari’s letter to Varchi reveals a remarkable skill in writing literary texts, which is the result of the education, certainly not a poor one, he received in his youth (Carrara 2011a), as well as a tireless ability to entertain an increasingly larger network of personal relationships, making use of correspondence as a privileged vehicle: the correspondence of Vasari, extensive since his early years (*Der literarische Nachlass Giorgio Vasaris*, Frey and Frey 1923–1940; Agosti 2010), testifies to his continual assiduity and friendship with scholars – Pietro Aretino, Paolo Giovio, Annibal Caro, or Lodovico Domenichi, just to name a few – while the artist was traveling in Italy, finding hospitality and commissions in the most important cities and courts, from Florence to Venice and Rome, from the “familia” of Alessandro de’ Medici to the circle of Aretino and the palace of Cardinal Farnese (see Agosti 2011, 2013; Carrara 2013).

The “Lives”

First Edition

The aforementioned letter written by Vasari to Varchi was an essential starting point for the drafting of the *Lives*, appeared in Florence in 1550, and was published by Torrentino (Vasari 1550, 1986). *Le Vite de’ più eccellenti architetti, pittori, et scultori italiani, da Cimabue insino a’ tempi nostri, descritte in lingua toscana da Giorgio Vasari pittore aretino* is composed of a dedicatory letter addressed to Cosimo I de’ Medici, the prefaces (one to the Whole Work and the other three before the three parts – *tre età* – of the *Lives*), and the biographies (from Cimabue to Michelangelo, and the latter was the

only artist still living except Benedetto da Rovezzano, a blind sculptor, “dead” for making art), followed by the conclusion, that is a letter to artists and to readers. It is in the preface to the Whole Work that Vasari elaborates the thesis expressed in his letter to Varchi, to achieve a new synthesis whereby the two arts, painting and sculpture, are both daughters of *disegno* (i.e., drawing, Vasari 1966–1987, I, p. 26), an innovative and successful formulation, which in turn had much in common with the views expressed by Varchi in his own text (Varchi and Borghini 1998, p. 43). For Vasari the unity of the arts (which are therefore sisters) was embodied by Michelangelo, the artist who is excellent not only in painting and sculpture but also in architecture, and for that reason he can rightly be called “divine” (Vasari 1966–1987, I, pp. 26–27): Buonarroti by virtue of his exceptional draughtsmanship and excellence in all fields of art puts an end to disputes between painters and sculptors.

Disegno is the common “father” of all the arts, a concept which Vasari described with greater fullness in the second edition of 1568 (Vasari 1966–1987, I, pp. 111–113), and its role is discussed extensively in the introductions to the three arts, that is the *Teoriche*, where Vasari explains and tries to set his technical knowledge: he analyzes in detail what materials can be used, their mode of utilization, the necessary skills for artists, and how they can learn these ways of proceeding (Vasari 1966–1987, I, pp. 31–172).

Vasari’s insistence on technical terminology is one of the main themes of the entire body of the *Lives*, and, as he anticipates and states in the abovementioned preface to the Whole Work, he apologizes if he had to use nonliterary terms but more suitable and precise words to express the language of the artistic profession (Vasari 1966–1987, I, p. 29). The use of that technical terminology arises from the intent to be fully understood, because the *Lives* was written for those interested in art and its history, such as artists, collectors, or scholars. This was the aim of Vasari, when he started collecting copious amounts of material for his book, and he wanted to make sure that, as he states in the Conclusion of

his work, anyone could read his *Lives* (Vasari 1966–1987, VI, p. 412). Again in the Conclusion of the *Lives*, Vasari explains how he collected his data, by trying to verify and check what he had learned from memories written by artists of the past or from oral stories by older artists (*ibidem*, p. 411). Vasari, indeed, in the preface to the Whole Work declares that he dedicated a long time to the collection of data on artists (Vasari 1966–1987, I, p. 30), and in the Conclusion he affirms that he had the help and support of many good friends (Vasari 1966–1987, VI, pp. 409–410).

Among the *buoni amici*, the name of Paolo Giovio cannot be left out, the scholar and bishop from Como, who met Vasari in 1532, when he was in Rome for the first time (Agosti 2013, pp. 16–17): Giovio, who began writing in Latin the *Lives* of some famous artists (*Vincii Leonardi, Michaelis Angeli et Raphaelis Urbinate vite*, in Giovio 1999, pp. 234–279), recognized the skills of Vasari also as a writer and encouraged him to write biographies of artists.

In a letter, dated September 2, 1547, Paolo Giovio urged Vasari to present his work to Benedetto Varchi, in order to have an informed opinion, equal to that of Annibal Caro, to whom Vasari had sent the *Lives* by then finished, as a letter written by Caro on 15 December of the same year confirms (see Frey and Frey 1923–1940, I, pp. 209–210).

The preparation of the text to be printed by Torrentino was begun at least by the end of November 1546, as a letter written by Vasari to Giovio testifies (see Frey and Frey 1923–1940, I, p. 175). A decisive boost arrived thanks to the writing of a complete apograph (i.e., a copy not by Vasari's hand) at the abbey of Scolca near Rimini, where the painter worked for the Olivetan abbot Gian Matteo Faetani between September and December 1547. On this specimen intervened, by correcting its mistakes, Pier Francesco Giambullari, in order to proceed with the preparation of the copy to be sent to the Torrentino workshop; Giambullari then checked the mere typographic work, together with Don Vincenzio Borghini, who assumed the task of drawing up the indexes and revising the text to remove as many errors as possible (Scapecchi 1998).

The charge against Vasari – strongly asserted in recent years (Hope 2014) – to be just one of the many authors of the *Lives*, which has to be considered only the result of the collaboration of several writers, and in particular of Cosimo Bartoli (Frangenberg 2011), as is clear from the diversity of writing and methodological approach between the prefaces, literally more refined, and the drafting of the *Teoriche* and the biographies, more colloquial (Blum 2011, p. 159), fails fatally thanks to a thorough reading of the correspondence of Vasari, documenting the precise sequence of events and the real role of the men of letters mentioned (Scapecchi 2011).

An allegation destined to disappear, moreover, thanks to a thorough analysis of the narrative structure and composition of the *Lives*, which shows clearly how Vasari reused – just in some particularly complex and sophisticated passages – historical texts and compendia written in the vernacular, widely present in the Italian book market in the mid-sixteenth century (Rubin 1995, p. 169 note 104; Carrara 2010–2012, p. 161), and so easily accessible to an artist, although the cultural dimension of this figure has been reduced recently (Hope 2010).

On the contrary, the *Lives* confirms once more the greatness of Vasari as a writer and author in the Italian Renaissance and his extensive knowledge of many sources (from Vitruvius to Leon Battista Alberti, Francesco Albertini and Sebastiano Serlio), sometimes no longer preserved (Rubin 1995, pp. 165–177; Fratini 2012).

Second Edition

The volumes of the first edition of the *Lives* – which caused both the resentful reaction of Michelangelo (so much troubled by the lack of firsthand documentation in his *Vita* that he asked Ascanio Condivi to write the *Vita di Michelagnolo Buonarroti*, Blado, Rome 1553) and the criticisms of Lodovico Dolce, eager to defend the Venetian art and the grandeur of Titian – were sold out quickly (Simonetti 2005, p. 105).

Vasari decided to draft a second version of the *Lives*. To this end, in just two months (between April and June 1566), he faced a long journey that took him from Florence in Central Italy (Rome,

Umbria, and the Marche) and then through Emilia Romagna to Lombardy and Veneto, and finally he returned to Florence via Ferrara, Bologna, and Pistoia (Davis 1981). The visual and documentary material collected in his travels was to be used to obtain accurate and reliable information on the main centers of Italian art and to allow him to see up close the work of the most important artists of his contemporary period.

Vasari changed in-depth and radically, therefore, the 1550 edition, aimed at the celebration of the greatness of Michelangelo, who died on February 18, 1564 (Ruffini 2011, pp. 85–88), by accepting instances that came from non-Tuscan areas and ultimately to legitimize his work as a painter and architect of the court of Duke Cosimo de' Medici, the dedicatee of his book.

The second edition, published by Giunti in three volumes in 1568 (Vasari 1568b), presents a greater number of *Vite* than the first one printed by Torrentino, but the biographies have almost always lost the wide introduction expressing thoughts of a moral nature (such as reflections about the good fortune or misfortune of artistic careers), present in the printing of 1550 (Pozzi and Mattioda 2006, pp. 310–330). The biographies are coupled with the artists' portraits: Vasari planned these engravings already for the first edition of the *Lives*, but he could realize his project only in the one printed in 1568 (Prinz 1966).

The second edition of the *Lives* represents a significant extension of the first both in chronological order and in its contents, as a result of thoughtful reflections by Vasari, thanks to the possibility of acquiring new information (Carrara 2012) and to constant comparison with Vincenzio Borghini. In a letter sent to Vasari on August 11, 1564, Borghini invited him to write a "comprehensive history of all paintings and sculptures of Italy" (Frey and Frey 1923–1940, II, p. 98), that is, a history focused more on works than on artists.

As a matter of fact, in the *Lives* published in 1568, even greater attention is devoted to techniques, especially those most neglected like engraving, which became the subject of extensive analysis in the *Vita* of Marcantonio Raimondi, as well as great importance was given to the production of engravings in the Flemish area, much of

which is indebted to the letter in Latin sent by Dominicus Lampsonius to Vasari on April 25, 1565 (Gregory 2012).

Significant additions were made to the *Prima Età* of the *Lives*, like the *Vita* of Nicola and Giovanni Pisano, sculptors, and architects, in a general expansion of information provided in its first section (Barocchi 2000), and was added the *Lettera di messer Giovambatista di messer Marcello Adriani a messer Giorgio Vasari*, which explains Greek and Roman art history, in order to fulfill the comprehensive information required by the competent authority of Borghini (Carrara 2011b, pp. 1–2).

A detailed description of the festivities of 1565–1566 on the occasion of the marriage of Francesco I de' Medici to Joanna of Austria is printed at the end of Vasari's paragraph on the Accademia del Disegno and its artists: the text, attributed in the *Lives* to "a person of leisure who delights not a little in our profession" ("persona oziosa, e che della nostra professione non poco si diletta," Vasari 1966–1987, VI, p. 255), was written by Giovan Battista Cini (Feo 1981; van Veen 2006, p. 93 and *passim*).

Other Writings

The vast amount of Vasari's letters – recently increased by new findings (Carrara 2010; Sottili 2011; Fratini 2013) – is only a part of the extensive body of his manuscript texts: the *Ricordanze* (Vasari 1927) and the *Zibaldone* (Vasari 1938) are important, in particular, for information provided about the career and the life of the artist.

In 1588, Giorgio Vasari il Giovane, Vasari's nephew, published his *Ragionamenti* (Vasari 1878–1882 [1588]), but the text – a long description of the works realized by Vasari and his workshop in Palazzo Vecchio – had already been in its manuscript form and was mentioned by Vasari himself in the *Lives*. The last book published by Vasari was instead the description of the ephemeral apparati for the baptism of Eleonora de' Medici in 1568 (Vasari 1568a), which testifies again to his seminal importance not only as an artist at the Medici court but also as an author in first person of literary texts in the Italian Renaissance of the sixteenth century.

Vatable, François

Born: ca. 1495, Gamaches (Picardy, Fr)

Died: 16 March 1547, Paris

Dick Wursten

Antwerp, Belgium

Abstract

François Vatable was a collaborator of Jacques Lefèvre d'Étaples at the Faculty of Arts in Paris in the 1510s. He translated, coedited, and published Old and New Latin translations of Greek philosophical texts (mainly Aristotle). He also assisted Lefèvre in the Evangelical reform experiment in the diocese of Meaux (1521–1525). In 1530, he became the first royal lecturer of Hebrew (later became the *Collège Royal*). He coedited and published the first Hebrew Bible (Robert Estienne) and participated in the production of a series of magisterial Latin Bibles also by Estienne. His name is associated with Estienne's Latin Bible of 1545, a parallel edition of the Vulgate and a New Latin translation. Since Estienne attributes the explanatory notes in this Bible to Vatable, it became known as the *Vatable Bible*.

Alternate Names

Guastebled; Ouastebled, François; Vatablus; Watablus; Wateblé; Wattebled

Biography

François Vatable was born in Gamaches (Picardy) as François Wattebled, probably in the last decade of the fifteenth century. After an education at the cathedral school of Amiens, he enrolled as a student in Paris. From 1511 onward, his name appears in books, prefaces, and other documents. He collaborated with Girard Roussel in providing a textbook for students on Aristotelian logic (*logices adminicula*). On behalf of Girolamo Aleandro, he completed an edition of the Greek grammar of Chrysoloras (1512). He appears to have been a young, dynamic postgraduate member of the Faculty of Arts in Paris, active at the *Collège Cardinal-Lemoine*, first as a student and soon lecturing himself. Pedagogically and spiritually, he belonged to the Christian humanist circle around Jacques Lefèvre d'Étaples. Apparently, languages were Vatable's forte. After having perfected his knowledge of the Greek tongue under the tutelage of Aleandro, he moved to Avignon to study Hebrew. After his return (ca. 1516), he embarked on the revision and translation from the Greek of a number of important philosophical treatises of Aristotle. He revised the old Medieval Latin translations, he edited available up-to-date translations (Argyropoulos), and if no modern translation was available, he provided one, based on Greek manuscripts and/or the famous Aldus edition – *Ex physiologia Aristotelis libri duodetriginta... Francisco Vatablo interprete. Quibus omnibus, antiqua tralatio tricenos libros continens, ad Græcum per eundem Vatablum recognita: columnatim respondet* (Henri Estienne: Paris, 1518 – Crantz/Schmitt 107.850). This voluminous book (336 folios) contains the old and the new translation side by side (the old though in a larger type), with summarized introductions and marginal notes. It appeared in print in 1518 with Henri Estienne. The texts in question, *Physica*, *De Caelo*, *De Anima*, *De Generatione et Corruptione*, and the so-called *Parva Naturalia*, are all works from Aristotle, "the Philosopher" as he was then called, dealing with the world we live in, inquiries in physics, human and animal nature, psychology, astronomy, and meteorology. Separate editions of the

Vatable, François, Fig. 1 Portrait of Vatable in Theodorus Beza, *Icones, id est verae imagines virorum ... illustrium...* (Geneva, Jean de Laon, 1580)

works of Aristotle were extracted from this compendium and printed as student textbooks (for an example, see Fig. 2).

In the 1520s, Vatable followed Lefèvre to Meaux to assist Bishop Guillaume Briçonnet in his experiment to reform his diocese. Whether he actually preached or only assisted in the production of elementary biblical and homiletical material is not known. Under pressure from the conservative party in Paris, the experiment collapsed. In 1530, King Francis I appointed Vatable as a royal lecturer of Hebrew. This implied a public reading of texts (*lectio*), translating and explaining them (*sensus*). As such he taught an entire generation of French scholars to read and understand the Hebrew tongue. Very similar to what he had done with Aristotle, he now began to do with the text of the Bible: editing, emending existing translations by referring to the original texts, and – if necessary – providing new translations. For this, he – and his colleague royal

lecturers, but his name is singled out several times – collaborated with Robert Estienne (1538 onward), providing trustworthy editions of the Bible from a textual critical edition of the Vulgate (with marginal notes, 1540) to Hebrew Bibles *in quarto* in which almost every Bible book has a title page of its own (bilingual: Hebrew and Latin, 1539–1544). Vatable's name is explicitly connected to an edition of the 12 minor prophets in Hebrew, supplemented with the rabbinical commentary of David Kimhi (only the first had a Latin title; the rest was in Hebrew). He is explicitly mentioned as the one who provided didactical illustrations of Noah's Ark, the Tabernacle, and the Temple in Estienne's 1540 Bible. These were no products of an artist's imagination but carefully drawn scholarly representations based on the indications in the Bible itself, as explained below the pictures. A series of reprints of the Hebrew bible (this time in pocket size) appearing from 1543–1546 (13 parts) was apparently destined for students to make notes while Vatable lectured. Finally, Estienne claimed he used student notes of Vatable's *lectiones*, integrating them in the marginal explanatory notes of his beautiful Latin Bible *in octavo* of 1545. This Bible contains a parallel edition of the Vulgate and a new Latin translation from the original tongues with explanatory marginal notes. This Bible is sometimes called the *Vatable Bible* and the notes *Vatable's notes*, although many of the notes are also present in the 1543 Zurich Bible. In 1543, Vatable was named commendatory abbot of the Abbey of Bellozane (in the diocese of Rouen), a title and income he kept until his death on 16 March 1547.

Heritage and Rupture with the Tradition

With his translations and editions, Vatable is anchored in the humanist tradition of returning to the sources: *Ad fontes*. He wanted to restore the works of Greek and Hebrew authors by republishing them from trustworthy sources and if necessary translating them into Latin. The translation of the philosophical curriculum was a collective effort taking place under the *aegis* of Jacques Lefèvre d'Étaples. It was spread over

Vatable, François, Fig. 2 Title page of Vatable's translation of *Περὶ γενέσεως καὶ φθορᾶς* (Aristotle), *De generatione et corruptione libri duo* (Paris, Prigent Calvin, 1535)

three decades (1490–1522). Next to Lefèvre, Vatable collaborated with Josse Clichtove, Charles de Bouvelles, and Girard Roussel. By means of fluent Latin translations (imported from Italy or self-made), commentaries, introductions, and paraphrases, these scholars tried to recover and shed light on the true value of these ancient works. They were working on a linguistic level – new translation into Latin following the rules of Latin syntax, grammar, and idiom –

rejecting the medieval way (almost verbally Latinizing the Greek, deprecated as “barbarous”), because it was not acceptable anymore to the Latinists of the Renaissance and obstructed the reading and understanding of the texts. A similar motivation is behind Vatable's biblical activity: a text-critical edition of the Vulgate and editions of the Bible texts in the original tongue, with and without translations and notes. Since this implies a tacit deprecation of the church's official textbook

and Jerome's translation, this could only be achieved because the King himself protected both Vatable (royal lecturer) and Robert Estienne (royal printer). In theological matters, Vatable also showed himself a true disciple of Lefèvre d'Étaples, whose idea of combining pietas and scholarship, philology and theology, and tradition and modernity he seems to have interiorized. As in his work on Aristotle, Vatable wanted to improve the edition of texts, to help readers understand them properly, always keen on keeping in touch with tradition that has gone before (*trahatio nova et vetus*), even when the errors and shortcomings in the old translation are not covered up, building bridges rather than destructing bonds.

Innovative and Original Aspects

In his translation of Aristotle, Vatable shows a profound and deep knowledge of both the similarities and differences between Greek and Latin. He sometimes drops the generally accepted titles with which Aristotle's works in Latin were known. Editing *Περὶ γενέσεως καὶ φθορᾶς* (*De Generatione et Corruptione*), the custom translation of the first line remains as title, but the book begins with "De ortu autem, ac interitu eorum. . .," in English "On coming-to-be and passing-away." Concerning his biblical work, together with Robert Estienne, he prepared the first Hebrew Bible to be printed in France. Comparing this edition with its predecessors (the Rabbinical Bible of Bomberg, Venice, and the Polyglot Bible of Alcalá), Estienne's editions have some particularities which suggest that his editors were familiar with the Masoretic tradition. Most particular for this Bible, and exclusively Vatable, is the publication of Kimhi's commentary on the Minor Prophets. The way these texts are edited betrays the influence of Jewish publications dating back to the time before the Rabbinical Bible appeared. The notes in the Latin Bible of 1545 and the student notes of some of his lectures (*reportationes*) are characterized by a profound knowledge of the Hebrew language, syntax, and idiom. They also show that Vatable himself had

found the commentary of Kimhi very useful for studying the Bible. He shared Kimhi's conviction that the literal and historical meaning of a text (rabbinical: "peshat") is the most important and should be established based on a sustained philological reading of the text. This became a common exegetical praxis among biblical scholars and a characteristic element of reformed hermeneutics.

Impact and Legacy

Vatable's Aristotle translations were reprinted many times, and separate editions of them (in small booklets for students) were used to teach philosophy, not only in Paris but also in Lyon and soon also outside France. All his translations were included in Aristotle's *Opera omnia* edition which appeared in Frankfurt in 1593. From these translations, *De Generatione et Corruptione*, *Meteorologica*, and *Parva Naturalia*, were the most successful and had long-lasting effects. Vatable was known and respected as a translator, editor, and commentator of philosophical texts throughout Europe. The impact of Vatable's Hebrew teaching and his cooperation with Estienne in publishing the source texts of the Bible is also considerable. The attribution of the scholarly notes in Estienne's Latin Bible of 1545 spread his fame over Europe. These notes were de facto anonymous and only partly by Vatable, but since they were copied over and again in successive scholarly Bible editions (to name only the two most influential: Estienne's Geneva Bible of 1556 and the Salamanca Bible of 1584), these notes made his name. The full set was also included in Pearson's *Critici Sacri* (1660), a protestant Bible compendium that served as a source for other compendia for centuries. The same goes for the Roman Catholic tradition because Menochio included them in his *Brevis Explicatio Sensus Literalis Sacrae Scripturae* (1630). In secondary literature based on these editions, the glosses are often introduced with phrases like "Vatablus vertit. . ." or "ut interpretatur Vatablus," thus rightfully honoring the quality of Vatable's teaching while greatly overestimating the quantity of his contribution.

Vatablus

- [Vatable, François](#)

Vergerio the Elder, Pier Paolo

Born: 1368–70, Capodistria (today Koper, Slovenia)

Died: 1444, Budapest

Giovanni Cascio

Departament de Filologia Catalana, Universitat Autònoma de Barcelona, Barcelona, Spain

Abstract

Pier Paolo Vergerio was a particularly prolific and versatile humanist. After completing his early education in Padua, he was active in the noteworthy Italian environments of Florence, Bologna, and Padua again, cities in which he came into contact with some of the defining figures of early humanism: Giovanni Conversini, Francesco Zabarella, Coluccio Salutati, and Manuel Chrysoloras. The last two had a decisive influence on the development of Vergerio's intellectual identity. Moreover, his shared interests and cultural tendencies with the circle of Florentine humanists emerge sharply from the dedication of Leonardo Bruni's *Dialogi ad Petrum*

Paulum Histrum. In 1405, he entered into the service of the papal Curia under Innocent VII and Gregory XII, where he would remain until 1409, occupied by serious questions pertaining to the Western Schism. Vergerio participated in the unsuccessful council of Cividale and, after a brief stay in his native Capodistria, in the Council of Constance (1414–1418), he moved into the service of the Emperor Sigismund of Luxembourg. Relatively little is known of the last 26 years of his life in Hungary. His multifarious literary activity embraced diverse genres (both in prose and poetry) and was combined with a vast network of cultural relationships evident from his impressive letter collection. His works focus principally on a number of closely connected thematic cores to which Vergerio made original contributions: pedagogical theory, reflections on political orders and forms of state, the study of the classics, and the diffusion of the cultural legacy of Petrarch.

Alternate Names

Vergerius

Biography

Pier Paolo Vergerio (not to be confused with the intellectual and Protestant polemicist of the same name, to whom he was related) was most likely born between 1368 and 1370 in Capodistria (now Koper, Slovenia), the only child of Vergerio di Giovanni de' Vergeri and Ysabetta de Azonis (the date of birth accepted here is that proposed by McManamon (1996, 1–2), on the basis of Baron (1977, 599–604) and Calò (1939, 226–228); however, according to Smith (1934, XI–XII), who in turn follows previous biographers, Vergerio was born on the 23 July 1370). Leaving their homeland in haste when it was under attack by the Genoese, the family settled in Friuli, presumably in Cividale. From there, Vergerio moved to Padua and from 1385 dedicated himself to the study of grammar. A series of stays in Florence – between 1386 and 1387, in

1394, and between 1399 and March 1400 – were of particular significance for Vergerio's cultural development. These visits allowed him to come into contact with the circle of Coluccio Salutati (1332–1406), to meet Francesco Zabarella (1360–1417), who remained a long-term friend, and, on the last stay, to encounter the masterful teaching of Manuel Chrysoloras (1350–1415). Between 1388 and 1389 we find him in Bologna, teaching logic at the Studio and learning medicine; this phase resulted in the composition of the *Paulus* (Perosa 1983; Grund 2005), considered the first humanist comedy, in which an adherence to the theatre of Terence coexists with the atmosphere of the Bolognese university context. In 1390 he returned to Padua, where he would remain until 1397. In the years of his stay in Padua, Vergerio dedicated himself, beyond the study of law, to learning rhetoric at the school of Giovanni Conversini (1343–1408), at the time the intellectual most representative of Padua under the Da Carrara. It was at this point that he was given the task of producing an edition of the *Africa* by the local Petrarchists, a group led by Francescuolo da Brossano (d. 1405), Petrarch's son-in-law, together with the trusted Lombardo della Seta (d. 1390), principal manager of the Petrarchan legacy. The great epic poem, dedicated to the glory of Rome, remained incomplete and the expectation of the first generation of humanists around it was considerable. The choice of Vergerio as editor was certainly not made casually, as the young Istrian was among those under the protection of the influential Zabarella and was esteemed by Salutati, who had previously proposed himself as editor of the poem (Fera 1984a, 83–104; 1984b, 7–43).

In 1397, Vergerio returned to Bologna, from where he composed an invective addressed to Ludovico Alidosi and directed against Carlo Malatesta (Smith 1934, 189–202), the protagonist of the famous episode of the removal of Virgil's statue in Mantua. The work defends ancient authors (Robey 1969), in the context of a controversy on the lawfulness of studying the pagan classics that would reach its culmination in the 1406 clash between Salutati and Giovanni Dominici. A journey to Rome with Zabarella

followed, during which he came to know and develop ties of friendship with Cardinal Cosmato Migliorati, the future Innocent VII. Between 1399 and 1400, he took the previously mentioned visit to Florence, during which he attended the Greek classes of Chrysoloras. When the Greek scholar left Florence, Vergerio returned to Padua, where he remained until March 1405 and was conferred with the title of *doctor* in civil and canon law. Just a few months after this he moved to Rome and remained there until 1409 in the service of Popes Innocent VII and Gregory XII, principally occupied on questions relating to the Western Schism. He accompanied Pope Gregory to the Council of Cividale in 1409 and after its failure returned for some years to Istria. He contributed to the much more significant Council of Constance (1414–1418), where he supported the position of Emperor Sigismund of Luxembourg. After the Council concluded Vergerio followed Sigismund to Bohemia, where he made a decisive contribution to the diffusion of humanism in Germanic regions and in Hungary. The emperor held him in extremely high regard, bestowing the title of *Poeta laureatus* upon him. Very little is known of the last years of Vergerio's life in Hungary; he died in Budapest in 1444 (Zaccaria 1990, 400–401).

Impact and Legacy

Pier Paolo Vergerio was a leading figure among the first Italian humanists. His versatility and vastness of interests emerge most clearly from his epistolary *corpus*: 148 letters, of which he composed 131. The importance of this collection is not just in the abundant quantity of biographical data on the author it contains, but also in its rich detail on the environments and personalities with whom Vergerio was in contact. Beyond the aforementioned Zabarella, Salutati, Conversini, and Chrysoloras, his correspondents included figures of the caliber of Ognibene Scola, Gasparino Barzizza, and Guarino Veronese.

Vergerio's most significant works, recognized as such by his contemporaries as well as by successive generations of humanists, were concentrated around a number of thematic nuclei:

pedagogical thought, reflections on political systems and forms of state, study of the classics, and the diffusion of the cultural legacy of Petrarch.

His work *De ingenuis moribus et liberalibus studiis adolescentiae* (Gnesotto 1917–1918; Kallendorf 2002) established Vergerio as a figure of influence in the history of Renaissance pedagogical thought. Dedicated to Ubertino, the youngest son of Francesco Novello da Carrara, the text enjoyed immediate and persistent success, as is evident from the high number of manuscripts and printed editions it was transmitted through (McManamon 1999, 271–279). The work, as can be gathered from the dedication, has the formation of the youth of ruling houses as its objective, by way of a complete education based on liberal studies, the arts, moral philosophy, and physical and military exercises. The author accepts and amplifies some of the fundamental tenets of humanism, such as the necessity of the study of letters, to which a primary role was given in the formation of an individual. The intended purpose of the treaty cannot be limited to the pedagogical matrix alone, as it also ends up straying into the field of political theory. This can be seen from the debate surrounding the “civic” reading supported by Eugenio Garin (1957, 129–132) – and also advocated by Giuseppe Saitta (1949, 267–273) and Hans Baron (1966, 129–134; *passim*) – and rejected by David Robey (1973, 1980, 1983). One aspect which characterizes not only Vergerio's pedagogical writings but also his entire output is his theorizing on the forms of government. In the Italy of the time, this reflexion – combining ideal models with examples taken from classical literature and, above all, historiography – went beyond the theoretical dimension. Hans Baron (1966, 126–133), in particular, highlighted the ideological continuity between Vergerio and Salutati, on the basis of a number of texts but in particular a letter that Vergerio had written in the name of Cicero (Smith 1934, 436–445; Rizzo 1991). Presumably composed in 1394, the letter took inspiration from an earlier, similar example by his friend and patron Zabarella (Sottili 2015, 57–84). It is a response to Petrarch's *Familiare* 24, 3 (written following the Florentine poet's rediscovery of the *Epistolae ad Atticum* in 1345)

in which Petrarch reproaches Cicero for weaknesses such as inconstancy and for, in his advanced years, becoming involved with contemporary political conflicts and renouncing the *otium* that was more appropriate for old age. This line of argument was contested by Robey 1973, for whom the position of Vergerio could not be evaluated only from a political point of view – and therefore as an opposition between Florentine *libertas* and Paduan *Signoria* – so much as a more generic exaltation of the *vita activa et civilis* promoted (and personified) by Cicero, combined with an authentic admiration for him (Zaccaria 1990, 401). The response by Vergerio/Cicero, a full defense of the Roman orator's work, was interpreted by Baron as proof of Vergerio's full commitment to the ideals of Florentine republicanism, internalized at the time he had participated in Salutati's circle, from which he would abruptly move away in the following period at the service of the Carraresi.

In the years he spent in Padua, Vergerio was among the most prominent intellectuals at the court of the da Carrara family, whose cause he actively promoted. This emerges, as well as from the previously mentioned pedagogical treatise aimed at the offspring of ruling houses, from three orations: *De dignissimo funebri apparatu in exequiis clarissimi omnium principis Francisci senioris de Carraria* and *In funere Francisci Senioris* (Muratori 1730, 189–198), composed and given for the death of Francesco il Vecchio (both presumably dating from 1393), and the more engaged *Ad Franciscum iuniorem de Carraria, Paduae principem, pro communitate Patavina* (Muratori 1730, 204–215), in which he recalls the events of the reconquest of Padua from the Visconti (Ferraù 2020, 289–295).

In the same courtly vein, but of wider scope and stronger ideological commitment, are a number of other works: the fragmentary *De Monarchia* (Smith 1934, 447–450), a treatise in which the author puts forward in no uncertain terms the primacy of the monarchical order according to topical schemes (for example, the similarity to the divine order); the *De Republica Veneta* (Robey and Law 1975) a panegyric to the city of Venice; and the *De principibus Carrariensibus* (Gnesotto

1924–1925). This last is an incomplete history of the Paduan *Signoria* aimed at extolling its origins and deeds, constructed from biographies and equipped with an introduction that outlines the historiographical tradition of the Paduan state up to Francesco Novello (Ferraù 2020, 306–325).

It is also necessary to linger on Vergerio's more strictly scholarly activity. In addition to co-authoring a treatise on meter with Zabarella, he translated the Hippocratic Oath and the demanding *Anabasis* of Alexander by Arrian of Nicomedia from Greek. It was, however, his Petrarchan works that gave him a leading role in the history of humanist philology. Between 1395 and 1396, at the request of the Paduan Petrarchists, he not only produced an edition of the *Africa* but also supplied it with the *Argumenta*, poems made up of nine hexameters that summarized the material of the nine books, monostichs which gave an overview of the content of the entire poem, and a valuable preface, the *Sermo de vita, moribus et doctrina illustris poete Francisci Petrarce et eius poemate quod Africa inscribitur* (Solerti 1904), composed on the basis of primary materials including the rare *Epistola ad Posteritatem* (Refe 2014, LXXIV–LXXVIII).

Works

Vergerio was a highly prolific author. Below is an alphabetically organized list of his most important works with their known or most probable chronology. For a more detailed picture of the Istrian humanist's works (including those dedicated or erroneously attributed to him), accompanied by accurate lists of manuscripts and printed editions, see McManamon 1999, 267–323 (on which this section of the biography largely relies).

Arrianus Flavius, *Anabasis*: Latin translation with a preface to Emperor Sigismund (Buda, 1433–1437); *De arte metrica*, together with Francesco Zabarella (Padua, 1395); *De dignissimo funebri apparatu in exequiis clarissimi omnium principis Francisci Senioris de Carraria* (Padua, November 1393); *De ingenuis moribus et liberalibus studiis adulescentiae* (Padua, 1402–1403); *De monarchia sive de optimo*

principatu (Padua, 1400–1405); *De principibus Carrariensibus et gestis eorum liber* (Padua, 1390–1405); *De Republica Veneta* (Padua, 1402–1405); *De situ urbis Iustinopolitanae*, fragm.; *Epistolae*; *Epistola nomine Ciceronis ad Franciscum Petrarcam* (Padua, 1 August, 1394); *Epitaphium* for Francesco il Vecchio da Carrara (Padua, 21 November 1393); *Epitaphium* for Manuel Chrysoloras (Constance, April 1415); Hippocrates, *Iusiurandum*, Latin translation; *Oratio ad Franciscum Iuniorem de Carraria, Paduae principem, pro communitate Patavina* (Padua, 1392–1393); *Oratio in funere Francisci Senioris de Carraria, Patavii principis* (Padua, 21 November 1393); *Oratio pro fortissimo viro Cermisone Patavino ad illustrissimum principem Franciscum Iuniorem de Carraria* (Padua, 8 September 1390–January 1392); *Paulus* (Bologna, 1388–1390); *Petrarcae vita* (Padua, 1395–1396); *Quaestiones de ecclesiae postestate* (Constance, 10 August 1417); *Sermones decem pro Sancto Hieronymo; Testamentum* (Buda, 3 May 1444).

Vergil, Polydore

Born: About 1470, Firmignano (Urbino)

Died: April 1555, Urbino

Michele Lodone

Scuola Normale Superiore, Pisa, Italy

École des hautes études en sciences sociales,

Paris, France

Abstract

Polydore Vergil was a priest, humanist, and historian from Urbino who spent most of his life in England, where he moved in 1502 as a papal sub-collector. Besides a collection of proverbs that gave life to a dispute (and later on to a friendship) with Erasmus of Rotterdam, his most famous works, in all of Europe, were: an erudite encyclopedia about human origins and discoveries (*De rerum inventoribus*), and

an impressive history of England (*Anglica historia*), the first to be inspired by a humanistic method. Back to his home country in 1553, he died there 2 years later.

Alternate Names

[Virgili, Polidoro](#); [Virgilio, Polidoro](#); [Vergili, Polidoro](#); [Vergilius, Polydorus](#); [Vergil, Polydore](#)

Biography

Polydore Vergil was born in the castle of Firmignano, near Urbino, around 1470. His father's father, Antonio, a doctor, and astrologer, had been a professor at the University of Paris; his father Giorgio owned an apothecary in Firmignano. The Vergils were related to the Pini family, to whom belonged Teseo – Polydore's uncle – who was the author, around 1484–1486, of a treatise about wanderers (*Speculum cerretanorum*) which can be considered the ancestor of a literary genre that became widely popular in modern times.

Polydore studied in Bologna (probably attending the lessons of Filippo Beroaldo) and in Padua before he received the ordination in 1496. His first work, the *Proverbiorum libellus*, dates back to 1498 and was followed a year later by the *De rerum inventoribus*, respectively a collection of proverbs, and an encyclopedic catalog of discoveries and inventions. Both works became incredibly popular, giving their author European fame.

In 1502, the young humanist was at the service of the Roman Curia, and in the same year, he was sent to England, with the role of sub-collector, by Cardinal Adriano Castellesi da Corneto. Except for some brief interruptions, Polydore lived in England for more than 50 years, fulfilling prestigious roles and striking up a friendship with the most remarkable exponents of English humanism (from John Colet to Thomas More); but he also underwent a disgraceful period between 1515 and 1516, when he was arrested for the wish of the ambitious minister plenipotentiary of King Henry

VIII, Thomas Wolsey – who allowed his release only after having obtained from Pope Leone X the cardinal hat. During his long staying in England, Polydore wrote the dialogues *De prodigiis* (Vergil 1531) and around 1506 he was commissioned by Henry VII to write a fundamental history of England (*Anglica historia*) published for the first time in 1534 (and then, in expanded versions, in 1546 and in 1555).

He came back to Italy in 1553 and died in Urbino in April 1555 (Connell 2004).

Heritage and Rupture with the Tradition

The *Proverbiorum libellus* was published in 1498, 2 years earlier than the 1st edition of the more famous *Adagia* by Erasmus of Rotterdam. The two humanists had worked autonomously at their collections, and the debate about the priority of the one or the other work – raised by the opponents of the Dutch humanist – did not forbid the friendship between Erasmus and Polydore, as their written correspondence testifies (Ruggeri 1992, 2000).

Polydore carried on working at his *Libellus* until its 20th edition (1550), and in the same way, he re-elaborated and expanded on several occasions the *De rerum inventoribus*. To the three books of the 1st edition (1499), devoted to the conquests and the inventions of the *homo faber*, he added in 1521 five more books, where he investigated the origins of rituals and of religious institutions (Atkinson 2007). Humanist as well as priest, Polydore shows the same plot between rational criticism and theological explanations in the dialogues *De prodigiis*, where he adopts the naturalistic point of view of Cicero's *De divinatione* to deny the existence of the pagan prodigies, not of Christian miracles.

Polydore's critical and comparative method emerges far more clearly in his *Anglica historia*, England's first history carried out with a humanistic method, so that it has remained a reference point for English historiography, until the nineteenth century.

Impact and Legacy

All Polydore Virgil's main works had a great fortune, with their several reprints and translations in the main European languages, but the most extraordinary fame went to the *De rerum inventoribus*, that could count, within the end of the seventeenth century, on more than 100 editions.

The IV–VIII books of the *De inventoribus* felt the effects of the events linked to the Reformation, and for the frequent criticism against the ecclesiastical decadence or practices like the ecclesiastical celibacy and the indulgences, the encyclopedia was inserted on several occasions in the *Index librorum prohibitorum*, and various expurgated editions were planned (Lodone 2010).

Vermigli, Peter Martyr

Born: 1499, Florence

Died: 1562, Zürich

Stefano Gulizia

Milan, Italy

Institute for Research in the Humanities,

Bucharest, Newark, NJ, USA

Abstract

Peter Martyr Vermigli is still largely unrecognized among the spiritual fathers of the Protestant Reformation. His career is neatly divided by his flight to Zürich in 1542. Prior to that, one can see the fruits of his superb philosophical and theological education in Italy, which manifested themselves primarily through scriptural commentary and Aristotelian exegesis. Afterwards, he participated – and always at the forefront of the debate – in increasingly harsher controversies ranging from liturgy to the Eucharistic doctrine. In his last years,

beginning in 1556, Vermigli finally settled as a Hebraist, teaching in a prestigious and non-Lutheran academic stronghold.

Biography

Peter Martyr Vermigli, born Piera Mariano, is probably best known for what has been called his “stromatic theology” (McLelland 2009), that is to say, the application of fifteenth-century, miscellaneous principles to biblical commentaries. The extent and organization of this method is especially visible in Vermigli’s *Loci Communes*, a compilation first published posthumously in 1576, which became a standard Reformed theological textbook. In the intellectual persona of this Protestant humanist, however, came to fruition several strands of thought within and beyond the Reform and the controversial history of the Reform’s censorship in print – namely, an effort to harmonize Aristotelian *Ethics* with the Bible, with beloved patristic commentaries, and with what Vermigli himself (amidst obvious sympathy) referred to as the wisdom of “Rabbinic sources.”

The eldest of three children, Vermigli was born in Florence (on September 8, 1499) to Maria Fumantina, who taught him Latin before he enrolled in school, and to Stefano di Antonio Vermigli, a wealthy shoemaker and former follower of Girolamo Savonarola, who strongly supported religious leadership in urban areas. Encouraging these ideals, the young Piera was sent to train at the Badia Fiesolana, from which, after obtaining his novitiate in 1518, the Lateran Congregation would send him to the monastery of St. John of Verdara in Padua to study Aristotle. While in Padua, Vermigli taught himself Greek and made the acquaintance of Reform-minded theologians such as Pietro Bembo, Reginald Pole, and Marcantonio Flaminio. Following his ordination in 1525, Vermigli embarked on a fruitful decade of traveling and lectures, in which he also mediated with Roman authority in his capacity as a Spoletan abbot and taught himself Hebrew. In 1537, he moved to Naples where he entered into circles of *spirituali* led by Juan de

Valdés: even though, at this juncture, Vermigli's passage to Protestantism is undeniable, the influence between him and Valdés is now believed to have been mutual (James 1998). Still, suspicion towards Vermigli's preaching began to gather as early as 1539 and was dispelled only thanks to the intervention of his powerful Paduan friends. Two years later, Vermigli was appointed prior of the Basilica of San Frediano in Lucca, which he energetically sought to wake up from its moral laxity; in addition, by exercising his episcopal authority, he also reformed the university curriculum by following the humanistic model recently implemented at the Corpus Christi College in Oxford, where teaching was in Greek, Latin, and Hebrew as well as aimed at clarity and simplicity.

The year 1542 marked the downfall of Vermigli's cautious approach. A combination of factors – the reorganization of the Inquisition and the political fear that Lucca, commonly viewed as a Protestant haven, would lose its independence from the Holy Roman Empire – made Vermigli escape to Zürich. Once established as a professor in Strasbourg, he spent the first part of the 1540s lecturing on minor prophets, befriending Martin Bucer, and beginning his marriage to his first wife, Catherine Dammartin. After the accession of Edward VI to the throne of England, with the continental advances of Charles V making Germany a hostile environment to the Reform, Vermigli sailed with Bernardino Ochino on an invitation to teach at Oxford. Since 1548, his lectures – like those on 1 Corinthians (Balserak 2009), where he denounced the Catholic doctrines of Purgatory, celibacy, and Lenten fasting – caught fire both with the clergy and the academics, on one side, and common people on the other. A formal disputation organized by the University Chancellor, himself a firm Protestant, was held at Leuven in 1549, in which Vermigli argued against transubstantiation. This placed him at the forefront of the debate over the nature of the Eucharist. Opposition, though, was fierce. Only 2 years after his return to Oxford, rioters in the streets threatened Vermigli with death, and his windows, overlooking Fish Street at the Great Quadrangle, were smashed several times (McNair 1994). While his deep involvement with English church

politics is signaled by the changes he recommended to the *Book of Common Prayers*, the accession of Mary I of England brought to an abrupt end Vermigli's days in Oxford. In fact, after 6 months of house arrest, he narrowly escaped execution, but his wife, well known in the city for her piety and ministry, died childless slightly before he departed for Strasbourg in 1553.

Vermigli was restored to his previous post as a lecturer but not without controversy. He turned his attention to Aristotle's *Nicomachean Ethics* and his house became a place of gathering for Marian Exiles (Anderson 1996). At the same time, he was asked to sign the Wittenberg Concord as a condition for his reappointment, for Vermigli's doctrine of double predestination continued to sit uncomfortably with the Lutheran establishment. In an atmosphere of increasing alienation, despite renewed friendship with Girolamo Zanchi, a former Protestant convert under Vermigli in Lucca, the professor moved to Zürich in 1556 to teach Hebrew and would never move again until his death. Three years later, he also married his second wife, Catarina Merenda of Brescia. At first, the Hebraist Theodore Bibliander shared teaching duties with Vermigli, but in 1557, he openly attacked his double predestinarian views, at one point allegedly challenging him to a duel with a double-edged ax. Eventually, Vermigli's own position emerged as the official, allowable stance of the Zürich church (Steinmetz 2001), but another front had already opened when Zanchi in Strasbourg was attacked by the Lutherans for heretical teachings on the Eucharist. During the abortive conference at Poissy in 1561, which he attended with Theodore Beza, Vermigli enjoyed talking to Catherine de' Medici of France in his native language and defended the view that Jesus' words at the Last Supper were figurative rather than literal. His health already declining, Vermigli succumbed to an epidemic fever in 1562, attended by the physician Conrad Gesner.

Heritage and Rupture with the Tradition

Vermigli's theology is notable for having developed a strong doctrine of double predestination

independently of John Calvin. (His belief is overall similar but not at all identical to Calvin's.) Moreover, his presence and activity in England fueled important political developments in the Elizabethan religious settlement, providing theological justification for Royal Supremacy, that is, privileging the king of a territory, instead of any ecclesiastic authority, to rule the church. With that said, however, at least from an Italian point of view, Vermigli's trajectory should be mapped as the overarching profile of those lives, Erasmian or not, who suffered opposition from the Roman Inquisition and decided to flee Italy for a Transalpine location, therefore enabling a re-orientation of their intellectual heritage at once theological and geopolitical. In this respect, Vermigli could be appropriately compared to the experience of another exile, Pietro Perna (1519–1582), a leading printer in late Renaissance Basel. Perna was originally born in Villa Basilica, near Lucca, and was an admirer of Vermigli (Perini 2002); among the books he printed in Basel feature several Aristotelian commentaries, other titles that sparked a considerable theological debate, such as the *De amplitudine regni Dei*, of 1554, and a 1560 edition of Machiavelli's *Prince*, which substitutes the dedication to Lorenzo de' Medici with another one to the Polish knight Abraham Sbaski (Lepri 2013).

Vermigli's insurrection against the tenets of his early education represented, so to speak, the theological idiom of a larger intellectual discourse of sixteenth-century Italian dissent. If this is true, and remembering that Vermigli, like Erasmus, was much read in Venice and Lombardy (Seidel Menchi 1987), the situation with the circulation of forbidden, "heretical" books bears further scrutiny in order to better assess what the Florentine professor inherited and how he situated himself. Vermigli's Paduan years marked a substantial axis in his career; as such, they also implicate two groups of participants – the German Protestant students enrolled at the University of Padua and the German Protestant merchants, living and working at the Fondaco dei Tedeschi in Venice. In each case, curiosity had to be sustained by conversation. And religious sympathy for the Reform had to be wrapped or materialized

through the study of actual books. Thus smuggling and shipping illicit titles is an activity that binds at least two major routes: one proceeding from Switzerland to Chiavenna to Venice and another surging from the activity of Greek copyists in Venetian-controlled locales such as Crete or Cyprus. Not only was Vermigli influenced by Greek Patristic thought – and possibly he read about Chrysostom in Oecolampadius' edition, after Erasmus himself proved to have been particularly drawn to this golden-tongued father (Kirby et al. 2009). One might as well take Vermigli as the figure who structured and repositioned at the heart of the continental reformation an acerbic line of rhetorical and Patristic commentary that first appeared in the Veneto, in correspondence with the East, and was subsequently persecuted through the inquisitorial files (Fragno 2001).

Against this background, two conclusions emerge. First, Vermigli's interests and changing notions of faith and theology mirror the objectives of humanist and lay circles such as those of Sperone Speroni, Antonio Brucioli, and Francesco Patrizi, who also collectively supported the trading of old manuscripts from the Levant (Chayes 2012). Second, and as a corollary, Vermigli's closest parallel in sixteenth-century intellectual history is, perhaps, Filippo Mocenigo, archbishop of Cyprus from 1560 until 1568, who was accused of heresy and possession of prohibited books in a harsher climate of repression (Bonora 2006).

Original Aspects and Legacy

In his epistolary exchanges, Cardinal Baronio reminded his adversaries of a long genealogy of converts who had broken their vows in order to follow true religion: in particular, Luther, a former Augustinian monk, Peter Martyr Vermigli, an ex-Dominican, and Martin Bucer. In itself, apologies aside, this is not extraordinary, although the Italian Reformation proved to be a frail and remarkably vanishing product of history. Yet, with the names of Vermigli and Bucer, one sees two scholars who had been offered leading professorial chairs in their time – respectively, in

Oxford and Cambridge – and were able to structure in a lasting organizational capacity two non-Lutheran strongholds in Strasbourg and Zürich. In their wake came hundreds of lesser asylum-seekers. And while an interesting, historical argument was put forward long ago (Carter 1924), that Vermigli's Eucharistic adjustments may perfectly plausibly be seen as an effort to update the liturgy to reflect developments in Reformed Protestant thinking, the letters traveling from Zürich to leading English exiles betray an atmosphere of mounting anxiety to see whether the new regime would be as aggressively Reformed as under Edward VI (MacCulloch 2005). In this context, Torrance Kirby's recent essay (Ha and Collinson 2010) fills an important gap, providing evidence to support his claim that the Reformed Vermigli played a pivotal role in the formation of the Protestant religious settlement under Edward VI and consolidation under Elizabeth.

In light of these considerations, Peter Martyr Vermigli should be recognized as someone who, before his flight to Zürich in 1542, was superbly educated as a philosopher, theologian, scriptural commentator, and, subsequently, as someone who was able to tie together the embryonic Italian Reformation and the Protestant theologies of Northern Europe. It was, in particular, his command of scriptural texts – along with the early fathers and Aristotle – that enabled him to set the tone of his contributions (Opitz 2011). Surprisingly, given his polyglot interests, he never wrote a popular treatise in vernacular. Vermigli's erudition, however, was never a mere ornament but a tangible sign of the boundaries and borders, confessional as much as political, that were dividing Europe and that no amount of learned discourse could overcome. Perhaps, as has been suggested, Vermigli's originality should be assessed through his biographic wanderings, not only his thought (Campi et al. 2002).

Although in several textbooks on the reformation Vermigli is seldom cited, his legacy deserves a greater appreciation based upon the impact that his figure was able to conjure up during his own life – despite the fact that he did not form a new church and was forced to be itinerant after

crossing the Alps. A good starting point is the decision of the Zürich seminary to appoint him as a Hebraist, on very favorable terms beyond the lecture room. Why was he so attractive to the council? Reaching two independent scholarly conclusions, Bauman and Bravi suggested that the city father knew about Vermigli's political views, and, fearful of the turbulence stemming from the countryside in previous decades, they thought his defense of a republican government would help create a clergy loyal to their authority. Moreover, drawing on Aristotelian exegesis and Florentine political discourse, Bravi further underlined Vermigli's description of Israel under the rule of the Judges as an ideal republic (Campi et al. 2002), which anticipates by many decades the European thesis on the "Hebrew commonwealth" (Nelson 2010). Before being highly regarded among New England Puritans, Vermigli's writings – and especially, his *Loci Communes* – were reprinted about 110 times between 1550 and 1650 and were probably consulted by John Milton when writing *Paradise Lost* (Donnelly 1976).

Abstract

Several debates existed vis-à-vis vernacular languages, in various parts of Europe, from the fourteenth to sixteenth century. Those languages underwent a process of progressive regularization, a limitation of the dialectal

variety, and the incorporation of new uses and registers, especially in those fields of the literate world that had retained Latin during the Middle Ages. The vindication and dignification of vernacular languages involved a slow but inexorable process of substitution of Latin in the learned arena, which entailed a redistribution of cultural prestige, a change in discursive models, and also the emergence of new agents. Nonetheless, this substitution did not occur in all languages in the same way or at the same rate.

Introduction

The European Renaissance witnessed a vindication and dignification of many of the vernacular languages. At the urging of humanists and intellectuals, European vernacular languages underwent a process of progressive regularization (mainly grammatical, lexical, and orthographic), a limitation of the dialectal variety, and the incorporation of new uses and registers, especially in those fields of the literate world that had retained Latin during the Middle Ages. The definition of “illustre vulgare” [illustrious vernacular], which Dante Alighieri proposed in his treatise *De vulgari eloquentia* (1304–1305), summarizes the initial phase of these processes: “dicimus illustre, cardinale, aulicum et curiale vulgare in Latio, quod omnis latie civitatis est et nullius esse videtur, et quo municipalia vulgaria omnia Latinorum mesurantur et ponderantur et comparantur” (Alighieri 2018: 212). [“I call illustrious, cardinal, courtly and curial vernacular of Italy that language that beats in all cities but is not perceived in any, and from which the municipal vernaculars of each city are measured, considered and compared.”]

Although the expression *lingua materna*, in reference to the vernacular language, was forged in the thirteenth century (Carrera de la Red 1988: 21) and the fact that awareness of the diglossia between Latin and the vernacular could even be traced back several centuries before, the Renaissance made the reflection on vernacular languages a central issue of its intellectual project.

Lacking homogeneous scope or depth, the process of dignification of the vernacular extended to Italian, French, English, Catalan, Spanish, and German, among many other languages and dialects. Hence, assuming the nuances and peculiarities of each case, one can speak authoritatively of a true question of language in the European Renaissance.

Between the fifteenth and sixteenth centuries, in various parts of Europe, several debates existed vis-à-vis language, of which the *Questione della lingua* surrounding Italian may be the most famous and extensive. These debates not only addressed the confrontation between Latin and the vernacular for legitimacy and cultural prestige but also served to raise the issues of how to think and update intellectual disciplines, how to connect the dignity of man with the dignity of language, and how to build a historical position from which to reread and appropriate the legacy of ancient times. Moreover, extralinguistic considerations intruded into these debates: religious (the translation of the biblical texts, for instance), political, and administrative issues (e.g., associated with imperial projects) and strategies for spreading prestige and social distinction (from one social group over another, from one region against another). In short, the debates on vernacular languages were the symptom and at the same time the fulcrum on which the construction of a new cultural and literary system pivoted, based on the need for a new code that allowed an audience to be addressed that would eventually accept, by the seventeenth century, a new relationship with language based on strategies, habits, and discourses that were distinct from Latin.

Heritage: Origin and Scope of the Problem of Language

The process of dignification of vernacular languages began, in general terms, when the first Italian humanists and philologists of the fourteenth century had to consider which language to use in their texts, while in other languages this “question about language” did not emerge until the late fifteenth century or even the early

sixteenth century. In the *Trecento* and, in general, in the early stages of each case (of each language), however, the debate did not focus on the vernacular but rather mainly revolved around the quality of Latin, a Latin that many considered corroded through scholastic applications and the poor linguistic knowledge of the clergy who had appropriated its cultivated use. Hence, together with the great Renaissance cultural project of the restitutum in integrum of ancient literature, the humanists set out to restore classical Latin with all its purity. Their aim, then, was “the repristination of its language and style” (Campanelli 2014: 140) and the eradication of medieval barbarisms. Finally, in the *Quattrocento* humanists succeeded in ensuring that the restored Latin, this new Latin, reached disciplines such as medicine, philosophy, and law, whose language of expression had been until then medieval Latin. This, then, was a debate that took place over time, which brings to mind the intervention of several generations of thinkers and influential figures such as Leon Battista Alberti and Lorenzo Valla in the fifteenth century and Desiderius Erasmus (Erasmus of Rotterdam) in the sixteenth.

In the heat of the debate on the quality of Latin, theoretical problems, arguments, and positions emerged that would make the incorporation of the problem of the vernacular into the dispute progressively indispensable. Thus, the emergence of historical awareness of the evolution of Latin (that Latin has always been a language with various registers) and also the acceptance of its artificiality or its insufficiency to convert it into a language of daily use would be added to the first evidence of the expansion of the vernacular to areas of cultural and literary prestige hitherto exclusive to Latin, as occurred, for example, with cultured literature that emerged in Occitan and French at the end of the twelfth century or the philosophical texts in Catalan of Ramon Llull between the thirteenth and fourteenth centuries. Both trends, the development of the debate on Latin and the evidence of the expansion of the vernacular, would contribute to the shift of the linguistic debate toward vernacular languages. Indeed, it is still necessary to remember what Stuart Hall Jr. stated in 1942: “the debates of

the *Questione della lingua* must be regarded rather as an effect than as a cause of the rise of the *koiné*, and as a faithful reflection of the problems facing the standard languages at the various critical points in its history” (1942: 1).

Nevertheless, it is important not to lose sight of the fact that the contrast between Latin and the vernacular at an early stage, when occurred, was articulated from a hierarchical and essentialist distinction by which Latin was, idiosyncratically, more refined than the vernacular. Thus, for example, when Íñigo López de Mendoza, Marquess of Santillana, wrote his defense of poetry in the form of the “Carta e proemio al Conestable de Portugal” (1449), he based it on a hierarchical distinction of languages as the basis of his literary hierarchy: Latin and Greek authors were described as “sublime,” while literary texts written in the vernacular were described as “mediocre,” and those from popular and oral genres also written in the vernacular were labeled “humble.” This perspective would become more nuanced as the debate progressed and incorporated a diachronic dimension and a historicist view on the study of language.

Innovative Aspects: Theoretical Approaches to the Problem of Language

Dante Alighieri wrote his treatise on *De vulgari eloquentia* between 1302 and 1305, although he left it unfinished midway through the second book (of four initially planned books). The treaty established two of the fundamental lines of development of the process of dignification of vernacular languages: the first was the need to construct a standard, to which the comparison between Italian dialects in Book I was dedicated; the second was the creation of a literary register for the vernacular, which the unfinished Book II sought through a formal analysis of Occitan troubadours and Italian *stilnovisti*. These two lines would form fundamental axes to the question of the dignification of the vernacular during the fifteenth century, despite Dante’s treaty not being the subject of debate until two centuries later. In this regard, it should be borne in mind that

Dante’s *De vulgari eloquentia* was not translated into Italian until 1529 (by Giangiorgio Trissino, one of the protagonists of the *Questione*), while the original Latin edition (by Jacopo Corbinelli, a Tuscan exiled in Paris) did not appear until 1577. The text, however, addressed some of the fundamental problems posed by this two-pronged approach.

Art and Use

The distinction between Latin as a language that had to be learned “by reason and art” (Carrera de la Red 1988: 56) and the vernacular, which was assimilated through use, was one of the most frequently mentioned bases on which to form the debate. Dante begins *De vulgari eloquentia* by proposing this distinct functionality: “quod vulgarem locutionem appellamus eam qua infantes assuefiunt ab assistentibus cum primitus distinguere voces incipiunt; vel, quod brevius dici potest, vulgarem locutionem asserimus quam sine omni regula nutricem imitantes accipimus” [“I call *lingua vulgar* that which children learn, [...] without obeying any rule”] (Alighieri 2018: 142). Then, referring to what Quintiliano referred to centuries before in his *Institutio Oratoria*, and even Seneca and Cicero (Väänänen 1988: 32–33), the Italian poet identified Latin with grammatical discipline: “Est et inde alia secondary locutio nobis, quam Romani grammatical vocaverunt. Hanc quidem secundarym Greci habent et alii, sed non omnes: ad habitum vero huius pauci perveniunt, quia non nisi per spatium temporis et studii assiduitatem regulamur et doctrinamur in illa” [“We also have another secondary language that the Romans called *gramática*. This secondary language is owned by the Greeks and other peoples, but not all; in reality, few come to possess it, since we manage to learn it and master it only through long and diligent study”] (Alighieri 2018: 144). In some cases, as would occur in the famous debate of 1435 in the anteroom of Pope Eugene IV, the assimilation of Latin with the scholarly disciplines that served to study it (rule versus use) would lead to the postulation of a distinct nature for each language and to the deepening the notion of diglossia, something

that deprived the vernacular of the essential quality by which it could be used in certain cultured contexts.

Contrary to this position, however, Dante attempted to base the priority of the vernacular on this distinction: “Harum quoque duarum nobilior est vulgaris: tum quia prima fuit humano generi usitata; tum quia totus orbis ipsa perfruitur, licet in diversas prolationes et vocabula sit divisa; tum quia naturalis est nobis, cum illa potius artificialis” [“Of these two, vernacular speech is the most noble [*nobilior*] because it was the first used by the human race, and because it was enjoyed throughout the world, although scattered in different pronunciations and terms; also because it is natural to us [*naturalis*], while the other is somewhat artificial”] (I, I,4). The opposition between the naturalness of the vernacular and the artificiality of Latin derived from the previous opposition between use and art.

As the debate on the ownership of Latin advanced, appeals to the literate would proliferate in order to make it a language of daily oral use, at least in school and university settings. These appeals were frequent, for example, in the Castilian arena of the fifteenth century (Carrera de la Red 1988: 62). Nevertheless, they led to an awareness of the insufficiency of Latin as a language of use in addressing more intimate and routine procedures and the difficulty of taking advantage of the oral use of Latin for its refinement. Indeed, in 1566, the vice-chancellor of the University of Salamanca, Juan Escribano, certified the failure of converting Latin into a language of use when he stated that “the style of speaking Latin was corrupted by the continuous speaking of Latin” (Gil Fernández 1997: 59).

Did the Romans Use Vernacular?

The first humanists inherited from the late Middle Ages the idea that in ancient times, a diglossia also existed, as occurred in their time between the Romance languages and medieval Latin, and that therefore two distinct categories of languages had always coexisted: the language spoken by the common people (such as the contemporary vernacular languages) and the written language (Latin) in such a way that “Latin, with its complex

morphology and syntax, was thus considered a creation of scholars, not subject to alteration over time; it represented a realm of stability, whereas vernaculars were the domain of mutability and disorder” (Campanelli 2014: 139). It was an artificial language, a *lingua franca* that served as a *koiné* to convey the expression and cultural exchange between literate people. Indeed, this notion regarding the nature of Latin, already expounded by Dante in his *De vulgari eloquentia*, justified the objective of the restitution of classical Latin previously mentioned. Only until well into the *Quattrocento* did some humanists begin to reject this thesis (Stever 1988: 377).

It was precisely the recovery of many works of classical Latin literature that encouraged some intellectuals to rethink the nature and use of Latin in antiquity, which sparked a famous debate about the existence of a vernacular in ancient Rome that took place in the antechamber of Pope Eugene IV in 1435 and that marked, undoubtedly, a turning point regarding the concept held until then about Latin as an artificial language and reserved for certain areas. The faction led by Leonardo Bruni adopted Dante’s position and maintained that ordinary Romans could not have mastered grammar and Latin (Stever 1988). Specifically, he said that Roman orators used the vernacular spoken in the street to deliver their speeches, speeches that were later written in *grammaticam Latinatam* [in proper Latin] to be set for posterity (Campanelli 2014: 141). At stake in this argument was a specific concept of rhetoric, whose scholarly application was in dispute in the fifteenth century according to which rhetoric was a formal art elevated above ordinary discourse. Antonio Loschi summarized this in his *Inquisitio super Undecim Orationes Ciceronis* (ca. 1498): “Sed altior res est eloquentia et a vulgari sermone remotior, quae licet plerumque in ambiguis communibusque versetur, ea tamen proprio quodam ac certo instituto continetur” [“Eloquence is a higher thing [than the conventions of daily speech] and more removed from vulgar speech and, even if it often concerns uncertainties and common things, still it is contained in its own peculiar and certain principles”] (Stever 1988: 377).

However, Leonardo Bruni did not propose a genuine diglossia in antiquity but rather a bipolarity between grammatical and non-grammatical language (although probably his opponents in the debate of 1435 did indeed interpret him as proposing a diglossia). In this regard, Strauss (1938: 42) highlighted that Bruni only spoke of an ancient vernacular language, which he considered independent with respect to standard literary Latin. “He had no historicist perspective on ancient Latin, and accepts the medieval conception that vernaculars are ungrammatical. For this reason, he cannot possibly claim a typological identity between Latin and the vernacular. In his letter to Biondo (1435), he states that the Latin language of the educated (*litterata lingua, sermo litteratus, sermo litteratorum, latine litterateque loqui*) in antiquity, in the time of Terence and Cicero, was distinct from the popular language (*vulgaris lingua, vulgaris sermo, sermo vulgi*), just as in his own time” (Eskhult 2018: 202). In short, Bruni positioned himself along the same lines as the medieval tradition that Dante continued, namely, in favor of a permanent bilingualism between Latin and Italian.

The opposing faction, led by Flavio Biondo (and later supported by Guarino Veronese, Francesco Filelfo, and Lorenzo Valla), defended the continuity, the relationship, between the language of oral use of the Romans and written Latin (*grammatica*). Biondo had read Cicero’s *Orator* and transcribed *Brutus* in 1422, a year after this fundamental treatise on rhetoric was unveiled. These texts, together with *Institutio Oratoria de Quintiliano* (rediscovered in 1416), were key in their conviction that Latin was truly a living language in common use in ancient Rome “and differences within the large Latin-speaking community were due only to a varying degree of refinement in its language usage” (Campanelli 2014: 141). Biondo was opposed, then, to the theory of bilingualism, arguing that in ancient times, there was only one Latin, in other words, a single linguistic unit of Latin, regardless of social class, gender, degree of literacy, and formal education. Nevertheless, this theory of monolingualism did not correspond to an idea of linguistic uniformity. Biondo

recognized the internal variation of ancient Latin both at the individual level and at the functional level according to a tripartite sociocultural division that could be correlated with the triple division of the rhetorical style of diction (*tres latinae dictionis formae*), which Cicero proposed, namely, *forma poetica*, *forma oratoria*, and *forma vulgaris*; the latter, the vernacular, “lacked artfulness and rules and was used by common people” (Eskhult 2018: 205–206). In the letter with which he intervened in the debate, Biondo also documents his argument with the survival of a Latin lexicon about knives or farm animals in isolated mountain villages and regions. This conviction, in short, led him to compare the linguistic functions of grammar and use: “he decides that grammar is not prior to but is the observation of usage” (Stever 1988: 378).

Moreover, in a fragment of his letter, Biondo includes the vernacular as an example of his argument: “I have no doubt that the multitude never knows tense, mood, number, a case from art, and, although they sometimes make mistakes, still, I observe them say much correctly and coherently. Everywhere, among all the Italians, those who speak with the most corrupt vulgarity, we see something instilled by the nature of language so that no one is so rustic, crude, and dull that, if he can speak at all, he will not know in speech to vary somehow tense, case, mood and number according to the exigencies of time and sense in narration” (cit. in Stever 1988: 379) [“Stationibus, ut video, erumpet, impetumque faciet quispiam et cornuta urgebit quaestione verborum ne desinentias et tempora ac modos nominumque inflexionem et numeros servasse an penitus confundisse multitudines credam. . . . Tempora vero modos numerosque et casus ab arte illas nequaquam nosse non dubito, quas tamen alicubi errante multa recte et ordine video proferre; quamquam omnibus ubique apud Italos corruptissima etiam vulgaritate loquentibus idiomatis natura insitum videmus, ut nemo tam rusticus, nemo tam rudis, tamque ingenio hebes sit, qui modo loqui possit, quin aliqua ex parte tempora casus modosque et numeros noverit dicendo variare, prout narrandae rei tempus ratioque videbuntur postulare”] (cit. in Stever 1988: 379).

In this fragment, Flavio Biondo anticipated the linguistic positions of Lorenzo Valla and maintained that it was the logic of the language that established the meaning of speech, with which the priority of the real referred thing versus the language, the position defended by Dante and Bruni, was reversed: the idiosyncrasy of each language was seen as a condition of the suitability and precision of that language to address or think about certain areas of reality and knowledge. In this way, the problem of language became a philosophical one.

However, the consequences and resonances of the debate did not end there: “This debate about grammar, besides producing ideas about knowledge and culture, enabled the Volgare finally to be treated on a par with Latin. In his letter, Guarino concludes that all languages — Hebrew, Greek, Latin, and Italian— are governed by everyday usage (*consuetudine*) not the reasonings of grammarians (*grammaticorum rationibus*)” (Stever 1988: 380). Biondo’s theses argued that ancient peoples had written in their vernacular language, with which the modern vernacular was enabled in literary terms and its natural inferiority questioned. Moreover, the awareness that in ancient Rome there existed a diastatic and changing Latin led to the notion that “for the first time, language became a subject of historical inquiry” (Campanelli 2014: 142).

Which Historical Vernacular Would Become a Model for Language?

When the *Questione della lingua* re-emerged in the first decades of the sixteenth century, the immutability attributed to Latin by the first humanists through its identification with grammar moved to the debate on the vernacular. One of the fundamental texts of the *Questione*, Pietro Bembo’s *Prose della volgar lingua* (1525), promoted the literary Tuscan of Francesco Petrarca (1300–1374) as the standard unitary language model. The *Prose* is a seminal text with multiple aims: “un dialogo maieutico, che in definitiva perverrà a descrivere-prescrivere dettagliatamente il modello fono-morfo-sintattico dell’italiano letterario (libro III), ma che prima di adempiere a questo storico ufficio si vorrà distendere sui

fondamenti e la storia del volgare (libro I) e sulla sua retorica (libro II). Il trattato che risulterà la fondamentale grammatica della codificazione letteraria italiana” (Tavoni 1992: 221).

Therefore, the *Prose* was not only a grammatical study on Italian but also a treatise on the vernacular in all its dimensions. Bembo’s position on the vernacular had developed from his editorial work for Aldus Manutius in 1501 (Petrarca’s *Rime Sparse*) and 1502 (*Le terze rime di Dante*), work which forced him to use a more demanding standard than that available to him (e.g., the one used by Cristoforo Landino a few decades earlier in his translations of Dante) (Campanelli 2014). Despite the fact that Bembo’s text was published in 1525, the celebrated autograph manuscript Vatican Latin 3210 allows us to conclude that the *Prose* was written over an extended period of time: the first news of it appeared toward the end of 1500, and by 1512 Bembo had only written the two first books (Tavoni 1992).

In his text, Bembo defended a model of literary, minority language that was fixed at a precise moment in history: the Tuscan *Quattrocento*. His correspondence with Pico della Mirandola in 1513 established the political dimension of his position: “rather than Pico’s democratizing general principles, Bembo makes it clear that his take on style is a theory of excellence, intended for a chosen few and consistent with a strictly aristocratic idea of art” (Campanelli 2014: 152). In this establishing of a refined model of language, Bembo opposed the model defended, among others, by Baldassare Castiglione. In *Il Cortegiano* (a dialogue set in Urbino in 1507 and written from 1513 onward and published in 1528), Castiglione defends an Italian based not on the use restricted to the archaic language of the triple crown of canonical authors usually cited as models (Dante, Boccaccio, Petrarca) or the centrality of a specific dialect (Tuscan) “but grounded in the vernaculars used in the main cities of Italy, especially by the courtly intellectual elites” (Campanelli 2014: 159). In short, a language “communal, rich and various, and like a delightful garden full of different flowers and fruits” (*Il Cortegiano* I.35). [Se adunque degli omini litterati

e di bon ingegno e giudicio, che oggidí tra noi si ritrovano, fossero alcuni, li quali ponessimo cura di scrivere del modo che s'è detto in questa lingua cose degne d'esser lette, tosto la vederessimo culta ed abundante de termini e belle figure, e capace che in essa si scrivesse così bene come in qualsivoglia altra; e se ella non fosse pura toscana antica, sarebbe italiana, comune, copiosa e varia, e quasi come un delizioso giardino pien di diversi fiori e frutti. Né sarebbe questo cosa nova; perché delle quattro lingue che aveano in consuetudine, i scrittori greci, elegendo da ciascuna parole, modi e figure, come ben loro veniva, ne facevano nascere un'altra che si diceva commune, e tutte cinque poi sotto un solo nome chiamavano lingua greca].

Bembo's attack on the courtesan language model defended by Castiglione pivots, again, on the normative role ascribed to its use: "no contro el nome ma contro la cosa, contro l'idea di lingua eclettica, interregionales e compromessa con l'uso parlato (che implicitamente copre anche la trissiniana *lingua italiana*), antitetica al compatto e classicistico modello bembiano mutuato dalla teoria dell'imitazione" (Tavoni 1992: 228). The novelty of this approach lies in the need to ask to what extent it is necessary to contain or repress the tendency for change and the variety of the language based on its use and opting for a stable and unitary model.

Bembo takes this idea from Dante's *De vulgari eloquentia*, whose text he had access to around 1510 despite the fact that Trissino's Italian translation had not yet been published (Pulsoni 1997). Bembo (a Venetian aristocrat who lived in Urbino and Rome) called for linguistic unity in the absence of political unity (as Dante did) after the political disasters experienced by Italy in the first quarter of the century. However, in prioritizing Petrarchan Tuscan, he does not observe a dialectal or political priority linked to its present but defends the prestige of that language that already enjoyed a literary register, which he strips of its oral traces. Thus, in his defense of the learning of ancient Tuscan, he states that contemporary Tuscan speakers had no greater advantage over others: "this suggests that Tuscan is exactly the same kind of *artificial*

language Dante in the *De vulgari* argues that Latin is" (Campanelli 2014: 157).

With this, he dignifies the vernacular with the framework that had previously served to place it hierarchically below Latin. In this way, Bembo's text is a turning point in the theoretical process of the dignification of the vernacular: "Bembo's treatise set the standard against which later literary, grammatical and lexicographical developments throughout Italy were to be measured" (Campanelli 2014: 162–163).

Do Languages Evolve or Does Each Language Have an Invariable Nature?

The debate of 1435, together with the counterposition of subsequent ideas vis-à-vis the vernacular between Pietro Bembo and Baldassare Castiglione, raised the issue of the existence of a dual concept regarding the nature of languages, which were classified into two categories: those immutable languages intrinsically associated with a grammatical structure and lexical richness that made them ideal for dealing with certain lofty issues (and, in a very particular way, religious issues) and those languages suitable for talking about common, lowly issues, precisely because they lack the grammatical factor and rich vocabulary and were determined by their use. That hierarchical concept of languages formed the basis of Dante's notion of the three divine languages (*tres linguae sacrae*): Hebrew, Greek, and Latin. These languages, in which the Holy Scriptures were written, were considered to be "shaped and regulated by rules, learnt through formal study and unchanging through time and space" (Law 2003: 231), which put them up against (and before) vernacular languages. Nevertheless, the process of dignification of the vernacular allowed some humanists to introduce into the debate on the grammaticality and stability of some languages and the historicity of others as a defining element. These oppose those that established a direct relationship between grammar and a structure of thought (Stever 1988: 369).

This philosophical and language theory problem was expressed very clearly by means of the concept of *copia*, which Erasmus developed

in his work *De Utraque Verborum ac Rerum Copia*, a small rhetoric manual that, inspired by the ideas of both Cicero and Quintiliano, concerned the imitation of words and ideas used by classical authors. He first wrote it in 1511, but the concept of *copia* was developed throughout his life. “*Copia* is an important idea in humanist philosophy of language, a concept used to demonstrate the nexus of language and thought. Besides this epistemological motive, *copia* is used in theory of culture. Many humanists share an idea of the history of language and culture, which is as follows: Languages develop through stages. In the primitive inchoate stage, few words are used to mean many things. The next is maturity, in which the use of language becomes self-conscious. There is reflection about language itself, which produces grammars and lexicons. The last phase is decline, in which the better conventions of the previous age are abandoned” (Steuer 1988: 370).

In reality, it was precisely the discovery and reading of Cicero’s works that allowed many humanists to become aware not only that Latin already had various registers in the classical era but also that, in addition, it was not always the lofty and divine tongue that Dante spoke of. And it is thanks to Cicero’s work that Latin was first a language of shepherds and soldiers, a little refined language, that the learned Romans used Greek to express themselves and write, and that it was Cicero, faced with the need to translate the ideas of Greek philosophers into Latin, who had worked to furnish the language of Rome with the philosophical vocabulary that until then it had lacked (Law 2003: 231).

This led some humanists to defend the notion that languages are not immutable by nature but that they evolve. At this time in history, then, Latin seemed to be experiencing a phase of decline both because of its “corrupt” state (which had motivated the recovery of classical Latin by humanists) and the evidence that most people no longer understood it. In contrast, vernacular languages found themselves in a phase of bloom and early consolidation. This is why, given the realization that these languages still lacked the tools to accurately and adequately

express lofty ideas (and, therefore, to speak or write about theology, philosophy, law, medicine, etc.), these humanists claimed that it was necessary to equip them with grammars and lexicons, since the vernacular had to be the usual language of expression, the language that most people understood and through which their works would reach a much wider audience. Together, this implied splitting off the tongues of a supposed immutable (and divine) essence and associating them with the cultural convention: associating them, in short, with the possibility of refinement. Thus, the need for grammars and lexicons was born, not simply through wanting to write in the vernacular works on philosophy or law (many of which are still written in Latin) but above all by having sufficient tools to translate those works from Latin (Ynduráin 1982: 22). Because until then, translations into the vernacular had suffered from a lack of vocabulary, formulas, jargon, grammatical solutions, etc.

One of the elements that clearly demonstrates the progressive preeminence of the vernacular versus Latin is the large number of translations of which we have evidence. Many of them, moreover, are commented self-translations, in which the author highlights the difficulty in finding the appropriate vocabulary. “For example, Alfonso de Palencia recognized and denounced the dearth of Latin of his time, agreed with Valera in translating compendiously and also harboured the same hope that his treatise would awaken curiosity in the originals” (Ynduráin 1982: 24).

Finally, it is important to point out that one of the areas in which the use of the vernacular would be highly relevant and revealing was precisely religion – not only in its daily use (e.g., in homilies) but, above all, in its learned use – which had until then been reserved for the *linguae sacrae*, of which we have two paradigm examples: translations of the Bible, on the one hand, and the texts written by the Castilian mystics, on the other.

The first case began with the first attempts to translate biblical texts into vernacular languages, which was driven by the appearance of the printing press, although the various reformist projects would be a key element in this process.

Thus, Martin Luther was fundamental both for his translation of the Bible and, above all, for his dignification of German: “Luther was not the first to translate the Bible into German, but he was certainly the first one to make vernacular German into the normative principle for the whole translation of the Scriptures” (Westhelle 2003: 20).

The second case, that of the Castilian mystics such as Saint Teresa of Jesus, Fray Luís de León, and Juan de la Cruz, sought in the expressiveness of the vernacular the possibility of transcribing mystical experiences into a written language, something that by nature they tended to reject or at least resist. Therefore, the language used must be accessible. Nevertheless, precisely because of their use of the vernacular, the mystics would be repressed by counter-reformist orthodoxy, who would see the use of a language other than Latin in religious texts as being something that had to be persecuted; the Counter-Reformation associated this fact with how the different reforms of Christianity in the sixteenth century made the translation of religious texts into the vernacular one of its fundamental pillars when defending individual contact with sacred texts. Somehow, then, the Castilian mystics kept the Erasmist footprint alive in their vision of an accessible, living language at a time when this legacy and this vision of language were viewed with suspicion for being alien to the counter-reformist positions resulting from the Council of Trent (1546–1563).

Is the Model of Language Associated with the Model of the Individual?

In some of the interventions on the problem of language, the quality of the language was identified with the quality and *dignitas* of the individual who used it. The linguistic debate thus extended to social and moral spheres. This issue appears frequently in texts dating from the first decades of the sixteenth century by authors such as Desiderius Erasmus, Baldassare Castiglione, and Juan de Valdés. However, the first accounts can be traced back to the Italian *Trecento*.

The first to highlight this identification were the Italian humanists – embodied in the figure and

work of Francesco Petrarca – who backed a restoration of the *latinitas*. From the *restitutio in integrum* of Latin literature, they sought to recover that which in Latin found its most lively and precise expression: “Thus the great barrier between the Middle Ages and the Renaissance was lifted; the cultural and pedagogical revolution, the *studia humanitatis* versus the formalism of previous studies, the *litterae* bearers of the authentic *dignitas homini* versus the cold scholastic theology, the reason that strives to seek the truth versus that which is debated in absurd syllogisms and apriorisms” (Carrera de la Red 1988: 27).

Erasmus’s approach to Latin (in which he wrote all his texts) followed this same line, although he defended a version of it that was more oriented toward practical and everyday spheres, an accessible lingua franca that allowed Latin to recover its use and lost vitality. The Erasmist mark and influence allow some significant features of a paradigmatic case, namely, Castilian, to be noted. From the problematic awareness of diglossia in the thirteenth century during the reign of Alfonso X, who encouraged the proliferation of translations, Castilian was furnished with the first grammar dedicated to a vernacular language in 1492 (by Antonio Nebrija). In the sixteenth century, Castilian embraced the Italian literary models as the beginning of a refinement that would culminate with the Baroque Castilian of the seventeenth century, which was capable of attaining a practically autonomous literary and cultural system with respect to Latin: “Latin, there is no one to thank it” [“latino ya no ay quien lo agradezca”] would affirm one of the characters from Félix Lope de Vega’s 1632 dialogue *La Dorotea* (1968: 243).

Due to its rapid evolution, its variation with respect to the Italian *Questione*, its complexity, and its extralinguistic resonances, it is worth pausing here to look in more detail at the case of Castilian. Carrera de la Red summarizes with great clarity the process carried out in the Castilian sphere: “upon the Latin model of the classical era, a humanistic Latin and vernacular were developed for literary and cultural expression that were distanced from scholastic Latin and

the *sermo cotidianus* and connected by the middle-vernacular, which, except in rare cases, humanists used in daily life” (167).

The first foundation of this process emerged in the first generation of Spanish humanists at the end of the fifteenth century. Antonio de Nebrija, one of its principal representatives, was commissioned by Isabel I to write a number of *Introductiones latinae* (1487) for learning Latin. In addition to representing a symptom of the insufficient spread of Latin among certain elites, this need to translate this text into Castilian led to Nebrija becoming aware of the difficulty in translating subjects of art, techniques, and metalinguistics into Castilian, which were not problematic for Latin. This would partially justify his project to formulate a *Gramática de la lengua española* (1492), the first one published for a romance language, and the preceding *Vocabulario español-latino* (1495). Before Nebrija’s project, Castilian was viewed as a communication tool that did not serve when addressing learned and literate areas.

In the prologue to his *Gramática*, Nebrija introduced a reference to the connection that had historically existed between the expansion and the unity of an empire with the unity and strength of its language, an argument that was not new but that was a prelude to the political implications that, from that moment on, the dignification of vernacular languages and especially Castilian would have in terms of its penetration into the American continent. This would go on to become one of the distinctive and central issues in the reflection on Castilian (Carrera de la Red 1988: 109).

The second issue was, as has been said, the Erasmist mark in the second generation of humanists, which coincided with the rise to the throne of Emperor Carlos I. Such influence would lead the reflection on the language toward more practical and less theoretical issues than those that characterized the Italian *Questione*. The influence of Desiderius Erasmus would become evident in figures such as Cardinal Francisco Jiménez de Cisneros, founder of the University of Alcalá and one of the promoters of the *Biblia Políglota Complutense* project (published in 1520), a

complete edition of the Bible with the same text in Hebrew, Latin, and Greek (with additions in Aramaic) arranged in columns for the purposes of comparison.

Another figure to be influenced by Desiderius Erasmus was Juan de Valdés, who wrote the *Diálogo de la lengua* in Naples in 1535, although it would not be published until 1577. The text is relevant because it based its reflection on the use of Castilian and was explicitly belligerent when it came to the “gramatiquerías” (Valdés 2014: 55). Indeed, he bitterly criticizes the academic dimension of the previous generation (Juan de Mena, Jorge Manrique) and, especially, Nebrija for his project to establish an *ars* for Castilian (although it seems that he never got to read his *Gramática*) and for his Andalusian origin, an attack that would reappear frequently in linguistic disputes, especially in texts from the courtly setting and the University of Salamanca, and that portrayed a territorial and political struggle for the prestige that would enable the establishment of a standard language model.

As Valdés was unable to find any literary works in Castilian that served as language models that Italians such as Bembo had indeed found in Petrarca, he chose to take as a model the sayings of the vernacular and common speech, his text thereby becoming a series of examples taken from the living language spoken at that time. Valdés defended a linguistic naturalism and, on this point, added the ideal championed by Castiglione to the Erasmist fingerprint. The Italian claimed, in his dialogue *Il Cortegiano*, which dealt with the model of behavior and of the individual, that “writing is nothing more than a way of speaking” (I, 30) [“io non posso negarvi che la scrittura non sia un modo di parlare”]. This commitment to the *llaneza* (simplicity and clarity) of Castilian could also be linked to the distinction between the areas of use with respect to Latin at the beginning of the sixteenth century: while Castilian was found in administration, preaching, and poetic texts, subjects related to teaching, science, philosophy, diplomatic relations, theology, or homiletic literature were practically exclusive of Latin.

Figures such as the poet Garcilaso de la Vega (1498?–1536) would follow that same commitment to naturalness and promoted a kind of “spoken writing” (Carrera de la Red 1988: 116) that was characterized by transparency and serenity. In his case, he perfected the adaptation into Spanish of the Italian genres and meters that the poet Juan Boscán, a friend of his, had begun to experiment on, as the latter explains in his famous epistle to the Duchess of Soma in 1526. Boscán and Garcilaso de la Vega fostered an experimentation with the hendecasyllabic verse and paroxitonic rhymes that would arouse certain controversy but would end up endowing Castilian with greater musicality and eradicate the acute verse characteristic of the *cancionero* poetry (songbooks) that prevailed in the fifteenth century, which retained a medieval-style trace (Rico 1983).

The first edition of the poems of Garcilaso de la Vega appeared posthumously as an annex to the complete works of Juan Boscán, which his widow published in 1543 (*Las obras de Boscán y algunas de Garcilaso de la Vega*). For an era that was so reluctant in accepting the *imitatio auctoris* of contemporary models, the rapidity with which the works of the Toledan poet appeared is significant. These works at first appeared in isolation (1569) and, shortly after, became the object of comments that claimed his status as the model author for the refinement of Castilian. The first to do so was the professor of rhetoric at the University of Salamanca, Francisco Sánchez de las Brozas. His *Anotaciones y enmiendas* to the poetry of Garcilaso appeared in 1574 and are a compendium of sources and “thefts” (*hurtos*) and a manual undoubtedly oriented at teachings (Viñas 2002).

Of a very distinct nature and a more formidable workmanship, the *Anotaciones a la poesía de Garcilaso de la Vega* by the Sevillian poet Fernando de Herrera appeared in 1580. Herrera did not limit himself to making an inventory of citations and motifs; instead, he took advantage of the poetry of the Toledan to put forward an authentic prose that was capable of adopting the language model of Garcilaso de la Vega that was

not, as a result, shy of formulating criticisms and differences. The need to convert Garcilaso into a language model was defended by Francisco de Medina in his prologue to the *Anotaciones* with the argument that Castilian was not a refined language because the “wise men” (de Herrera 2001) that were occupied with such an undertaking were more attentive to Latin and Greek. It was this barbarized state that led the Salamaca economist, Tomás de Mercado, in his *Suma de tratos y contratos* (1569) to raise this paradox:

“And so I have touched on writing in romance, I will not silence what many can take advantage of, what should be noted: that in order to write Latin it is enough for a man to be learned, but in romance it is necessary to be very learned and prudent, it is necessary that he writes much more clearly and plainly than in Latin and that he knows what in this language should be written. [...] To dictate in Latin it is enough to understand the subject well and, with the precepts of the dialectic, to have to hand the doctrine with good method. [...] However, writing in common language, [...] it is necessary to observe many circumstances, explain them with a plain and simple style, consider not only what has to be written, but also mainly what has to be silenced, to tie and take in the sails of understanding many times when it flies” (cit. in Ynduráin 1982: 20–21) [“Y pues he tocado el escribir en romance, no callaré lo que a mucho pueda aprovechar, conviene a saber: que para escribir latín basta un hombre ser docto, mas para en romance es menester ser doctísimo y prudentísimo, es necesario que escriba muy mas claro y llano que en latín y que sepa lo que en este lenguaje conviene escribir. [...] Para dictar en latín basta entender bien la materia y, con los preceptos de la dialéctica, disponer con buen método la doctrina. [...] Pero, escribiendo en lengua común, [...] es menester guardar muchas circunstancias, explicarlas con estilo llano y fácil, considerar no solo qué se ha de escribir, sino principalmente lo que se ha de callar, atar y coger las velas al entendimiento muchas veces cuando va volando”].

It was also this barbarized state in which Castilian found itself, therefore, that prompted the

possibility of also amending the poetry of Garcilaso. In these amendments appeared, for example, the criticism of the use of words employed for oral use and the defense of learned words and archaisms: “the old voices brought from long ago, as Quintiliano says in numerous places, are not only defended and welcomed and esteemed by some, but bring majesty to prayer, and not without delight; because they bring with them the authority of antiquity, which gives them value (saying it thus) that religion of their past” (431?).

Notes such as this latter one suggest the need to more noticeably separate the spoken language and the literary register. With the increasingly accepted incorporation of the rhetorical precept of *decorum*, according to which the dignity of the thing (*res*) must be reflected in the dignity of the way in which it is referred to (*verba*), the literary system shifted progressively toward stylization and a language model that began to move away from Garcilasian transparency and simplicity: “it is about looking for propriety, fleeing the affectation and the barbaric simplicity and elaborating the *elocutio* of the mother tongue” (Carrera de la Red 1988: 160).

In the last quarter of the sixteenth century, the process of dignification of Castilian seems to reach a certain balance and refinement: “in general terms, we could speak in the last quarter of the sixteenth century of vernacular classicism, essentially based on Horace, Cicero and Quintiliano, accepted by representatives of a cultured and *discreta* social class, with a desire to avoid vulgarity in speech and to endow their manifestations with essentially Renaissance values, somewhat forgotten in the world of the Counter-Reformation” (Carrera de la Red 1988: 164).

With the turn of the century, the generation of baroque poets led by Luis de Góngora and Francisco de Quevedo would intensify the formal artifice and, especially in the case of de Góngora, would introduce the veneration of poetic difficulty and hermeticism into literary Castilian, which would materialize in the *Soledades* (1613) and the *querelle* raised in the following years and decades. Although in 1611 Luis Carrillo y Sotomayor had theoretically cemented this search

for obscurity and difficulty through his *Libro de erudición poética*, it would be the intervention in the debate on poems of Góngora by some of the most relevant scholars of that time that would substantiate the culmination of the refinement of the Castilian that had begun with Nebrija.

The culmination of this linguistic process occurred alongside the replacement of the ideal of language and the model of the individual that was associated with it at the beginning of the sixteenth century. In the Baroque period, the predominance of the *inventio*, the ingenuity in the model of language, and the discretion in the model of the individual, replaced the veneration of Renaissance naturalness and simplicity (*llaneza*). It was then, with the awareness of the creation of a literary Castilian, when the process of dignification of Castilian culminated, which led it to a remarkable autonomy with respect to Latin, to the extent that a literary and cultural system had been built around the vernacular, with a specific code, public, models, conventions, and agents. Latin would endure as the technical language of scholastic philosophy, theology, and some sciences, but many symptoms of the discrediting of classical scholarship in different areas of society would appear. This is, indeed, what is understood of the phrase “*Latín, ya no hay quien lo agradezca*” [“Latin isn’t appreciated by anyone anymore”], uttered by Lope de Vega’s main character in *La Dorotea* in 1632.

Impact and Legacy: Unfinished Processes

The processes of vindication, refinement, and normalization of vernacular languages did not end in the Renaissance and continued for much longer, adopting the cultural, linguistic, and political inflections of each case and moment. However, as in the Renaissance, a reflection on the vernacular, the density of texts and ideas, its extension to the vast majority of languages, and its controversial friction with a language of prestige and tradition, as was once enjoyed by Latin, would never occur again. Regarding the latter, Latin, the vindication

and dignification of vernacular languages involved a slow but inexorable process of substitution in the learned arena, which entailed a redistribution of cultural prestige, a change in discursive models, and also the emergence of new agents, from academies to the public. Nevertheless, this substitution did not occur in all languages in the same way or at the same rate. Indeed, there are a wide variety of cases and nuances that, however, can be reduced to three descriptive paradigms that we propose below.

The first corresponds to those languages whose process of normalization was associated with the strengthening of central political power. This is the case, as mentioned, of Castilian, which was explicitly associated with the imperial expansion of the Hispanic crown during the sixteenth century. It is also the case of French, which underwent an intense process of orthographical, rhetorical, lexical, and literary regulation between 1530 and 1550. Perhaps the most famous text of that time, Joachim Du Bellay's *La Défense et illustration de la langue française* (1549), imported most of the arguments of Pietro Bembo's *Prose* into French. However, Du Bellay related his defense of French with the promotion of a new generation of writers (the *Pléiade*), who sought to position themselves within the literary field by breaking with previous authors and literary models; however, unlike Bembo, he refused to propose to these writers as a language model: "Ly, donques, et rely premierement (ò Poëte futur), fueillete de Main nocturne, et hournell, les Exemplaires Grecz et Latins: puis me laisse toutes ces vieilles Poësies Françoises aux Jeux Floraux de Thoulouze, et au Puy de Rouan: comme Rondeaux, Ballades, Vyrelaiz, Chantz Royaulx, Chansons, et autres temmes episseries, qui corrumptent le goust de nostre Langue: et ne servent si non à porter temoingnaige de notre ignorance" (Du Bellay 2007: 132).

Despite Du Bellay's recommendation to refine French by imitating the Latin and Greek of the classics, the support of this process by a central political power would end up turning French into the new *lingua franca* in eighteenth-century Europe. Moreover, its role of replacing

Latin, increasingly associated with ecclesiastical and scholastic fields, would burden French with opposing liberal and secularizing values, so that French would end up being identified with reformist, progressive tendencies in philosophy, politics, and aesthetics (Casanova 1999).

The second paradigm is populated by those languages that did not receive the support of political or administrative unification in the search for linguistic unification. Such is the case of Italian and German, among others. Their process of reflection and linguistic unification was extremely intense during the fifteenth and sixteenth centuries, and they promoted highly refined and mature language models. However, the persistent fragmentation of the regions in which these languages were used (the unification of Italy took place in 1861 and that of Germany in 1871) did not facilitate the spread of these models beyond small social groups and would make it impossible to bring to an end their respective *questione della lingua*. However, the fundamental arguments and criteria in the debate would be set during the Renaissance: some even suggest that the *questione* persisted during the seventeenth and eighteenth centuries without new elements being added to the discourse (Hall 1942: 9).

The third and final paradigm is occupied by those vernacular languages and dialects that enter into territorial, cultural, political, or demographic competence with another vernacular, whose influence closed the process of normalization of those minority languages or dialects, a process that was prematurely suspended or postponed. Many examples of this latter situation could be cited, but we will illustrate them with the case of Catalan. The Catalan language represents a process of expansion, dialectal fragmentation, and self-awareness during the Middle Ages similar to other peninsular languages mentioned, such as Castilian. It reached a peak in the fourteenth century as a language of significant cultural and literary use, which was accompanied by the commercial and political expansion of the Crown of Aragon throughout the Mediterranean. At the end of the thirteenth century, the Cancelleria Reial, created in 1264, ordered all

administrative texts to be written in Catalan, something which led to the need to establish a progressively unified language model for disparate territories and dialects.

In the first half of the fifteenth century, the Cancelleria began to use the common denomination of “Catalan language” for all the territorial dialects, despite the fact that the disparity of denominations (Valencian, Mallorcan, etc.) predominated (Ferrando and Nicolás 2011: 165). It is at this time of linguistic consolidation that the influence of the Castilian nobility would gradually introduce its linguistic uses in areas of social and cultural prestige. This process would culminate in 1479 with the federation of the crowns of Aragon and Castile and the economic, demographic, and cultural preeminence of the latter over the former. The dignification of Catalan would continue during the second half of the fifteenth century with translations as significant as Bonifaci Ferrer’s Bible and the lexicons, such as Pere Miquel Carbonell’s *Regles d’esquivar vocables o mots grossers o pagesívols* (1492); however, the progressive expansion and political promotion of Castilian would convert Catalan into a subordinate language from a cultural and economic point of view during the sixteenth century: “As noted in the printed language of the beginning of the sixteenth century, Catalan started a process of cultivation, but adverse political conditions prevented this process from resulting in the process of grammatization, which would have placed it on an equal footing with the great Romance languages of the time” (Ferrando and Nicolás 2011: 173) [“Segons es constata en la llengua de la impremta de principis del segle XVI, el català encetà un procés de cultivació, però les condicions polítiques adverses impediren que aquest procés desemboqués en el de gramatització, que l’hauria situat en condicions d’igualtat amb les gran llengües romàniques de l’entorn”]. Thus, the process of the normalization of Catalan, as with other languages, was suspended and postponed until the twentieth century, when it was resumed following several attempts to rehabilitate and vindicate it throughout the nineteenth century.

Vernia, Nicoletto

Born: 1420, Chieti/Italy

Died: October 5, 1499, Vicenza/Italy

Ennio De Bellis

Department of Humanities, University of Salento, Lecce, Italy

Abstract

Nicoletto Vernia is the greatest Aristotelian of the fifteenth century and has contributed to all the most important aspects of the speculation of his time: gnoseology and the problem of the immortality of the soul, logic, physics, and the theory of *impetus*, research methodology and the theory of *regressus demonstrativus*, cosmology, and the metaphysics of celestial intelligences.

He claims the autonomy of physics with regard to metaphysics and the superiority of natural science.

Vernia was a pupil of Paolo della Pergola and Gaetano of Thiene and successor of the latter as professor of *Philosophia* at the University of Padua in 1465. He has among his pupils, Pietro Pomponazzi, Agostino Nifo, and Giovanni Pico della Mirandola.

Alternate Names

Vernia, Nicoletto; de Vernia, Nicoletto; Vernia, Niccolò; Vernia, Nicolò; Vernia de Chieti, Nicolettus; Vernias Theatinus, Nicoletus; Vernias, Nicoletus; Vernias, Nicolettus; Vernias, Nicholetus; Verniatus, Nicoletus

Biography

Nicoletto Vernia was born in Chieti, around 1420, the son of Ser Antonio Vernia, who was also born in Chieti.

He declares that he spent his youth in Venice as a guest of the noble family of Sebastiano Badoer,

of which some members were the Patriarchs of Venice.

An important phase of Vernia's education is his period of study at the Rialto School where he is a pupil of Paolo della Pergola.

Paolo della Pergola is of particular importance since Vernia regards him as his first teacher.

In 1442, he had become a rector of the school annexed to the Church of San Giovanni Elemosinario in Rialto in Venice and remains here until 1455, the year of his death.

After Paolo della Pergola, many distinguished scholars of the University of Padua teach in this school, so, from the second half of the fifteenth century to the end of the sixteenth century, the school is a branch of Padua's University where many young Venetians begin their studies of logic and natural philosophy, which they then complete at the University of Padua where they obtain their doctorate.

It should therefore be remembered that the curriculum of studies conducted in the Rialto School has as its fundamental subjects the Aristotelian disciplines included in *Organon*, *Physics*, and *Metaphysics*, as well as *Mathematics* and *Abacus*.

It is evident, then, that there is a direct connection between the didactic activity of the Rialto School and the scientific activity of the Faculty of *Artes* of the University of Padua, and therefore, there is a direct progression of Vernia's education that passes from the magisterium of Paolo della Pergola to that of Gaetano of Thiene, the most important professor of *Philosophia naturalis* at the Faculty of *Artes* of the University of Padua from 1422 to 1465.

Vernia then reports that, after graduating, he goes to Pavia to study logic and physics according to the theory of the *Calculatores*, and studies in depth the doctrine of Richard Swineshead.

He began his professional curriculum in 1466 with the *primum gradum profitendi* qualification in the teaching of *Philosophia Naturalis*.

The year 1468 is the most important year in the career of Vernia, who becomes an ordinary professor of philosophy in the chair previously occupied by his master Gaetano of Thiene.

On June 20, 1469, Vernia is admitted to the Sacred College of Doctors and Philosophers of the University of Padua. The prestige of this institution is increased by the fact that only the members of that college have the right to promote the admission of those who are worthy of the graduation exam.

The first work as editor of Nicoletto Vernia is the edition of *De coelo* written by his master Gaetano of Thiene to which he adds his *Quaestio de gravibus et levibus* (Vernia 1474), which is both the subject of his studies as a youth, and the main field of research of his master.

Concerning the text of the *quaestio*, Vernia, starting from Averroes' doctrine, discusses the local motion of heavy and light bodies, that is, whether they receive the motion externally or possess the motion internally as an intrinsic *virtus* that develops once the obstacles that hinder it are removed.

Vernia confirms his full adherence to Averroes' doctrine which appears to him the most faithful exposition of Aristotle's thought. Movement leads the bodies to their natural places, where the element of the body is present in greater quantities.

Vernia can thus oppose Averroes' thinking against the doctrines of *Calculatores* by pointing out his criticism, above all, of the thought of the scholars of the University of Paris.

He mainly takes into account the theories of Albert of Saxony and his supporter Gaetano of Thiene. According to Albert of Saxony, the *impetus* with which an object falls into the void is a virtue that the object acquires together with the progressively achieved speed and with the time it takes to reach the stasis point, regardless of the medium in which the movement takes place.

Marsilius of Inghen is instead the opponent less contrasted by Vernia, who proposes a mediation between the doctrine of *Calculatores* and that of orthodox Aristotelians, believing that air performs an auxiliary function in motion as the *impetus* is transmitted not only to the moving object but also to the air surrounding it.

In February 1480, Nicoletto Vernia completes and publishes in Padua the volume of the *Commentaria* to the *De generatione et corruptione* of Giles of Rome, Marsilius of

Inghen, and Albert of Saxony, which is the second printed work of which he is the editor. Even in this edition, as he usually does, he adds his own *quaestio*, the second in order of a printed publication, which is titled *Quaestio an ens mobile sit totius naturalis philosophiae subiectum* (Vernia 1480, cc. 129r–131v).

In this work, Vernia identifies those that, in his opinion, are the fundamental conditions for unambiguously identifying the object of natural science.

One of these conditions is to set as a subject of study a natural entity that rigorously belongs to the perceptible reality.

Another condition prescribes that the goal of science is universal in every respect: it must therefore be a possible predicate of all entities in a direct or indirect way.

Another condition is that such an object not only does not transcend natural reality but is not confined to any particular science so that its validity can be verified in every field of research.

In 1480, Nicoletto Vernia wrote his first treatise on the intellectual soul titled *Utrum anima intellectiva humano corpori unita tanquam vera forma substantialis dans ei esse specificum substantiale, aeterna atque unica sit in omnibus hominibus*.

In this first *Quaestio de unitate intellectus*, left in manuscript form, Vernia studies the nature of the intellectual soul and, in particular, examines whether it is united to the human body as its true substantial form or whether it exists separately from the body and is incorruptible, eternal, and unique for all human beings.

The subject of discussion is how the nature of man is to be understood, that is, whether it is of a corruptible nature or whether it is composed of an aggregate of a corruptible nature and intellect.

If he had only a perishable nature, man would not have intellectual attitudes or tend to happiness, as such characteristics are only of the aggregate of corruptible and incorruptible nature.

It is interesting to note the distinction that Vernia makes in the definition of the aggregate that enables the intellectual activity of man.

He emphasizes, in fact, that the bond that unites the intellect to the body, while being of a

substantial nature, cannot be considered similar to the one that exists between matter and form, since it is restricted to a single function which is precisely that of knowledge.

However, such an aggregate of intellect and corporeal matter makes it possible to exercise rational function, since the body cannot exist or exercise its functions without the intellect and, vice versa, the intellect receives its perfection from the body, that is, the ability to operate.

On July 31, 1481, Nicoletto Vernia fulfilled, in Padua, the *Quaestio an coelum sit ex materia et forma constitutum vel non* (Vernia 1483, cc. 3r–5v).

Vernia, therefore, provides the ultimate answer to the question posed by the *quaestio*, consisting of whether heaven is made up of matter and form or not, moving from the observation that, according to the original doctrine of Aristotle and Averroes, heaven can be considered in four ways. It can be considered as the whole universe, as the entire celestial sphere, as the aggregate of all the individual celestial spheres, and as the aggregate of the intelligence and of its sphere.

Considering heaven in the fourth way, that is, as an aggregate of intelligence and its sphere, Vernia can thus clarify that, according to Aristotelian–Averroistic perspective, heaven must be considered a unique compound of matter and form whose being is identical in each of its components so that the movement of heaven itself, which is determined by its intelligence that animates it, is produced by an absolutely harmonious synergy of potency and act. Consequently, it is animated by an intelligence that has as its attributes *intellectus* and *virtus desiderativa* but not *virtus imaginativa*.

Considering heaven in the first way, that is, like the whole universe, one cannot properly identify a difference between matter and form. Considering heaven in the second and third way, that is, as the whole celestial sphere or as the aggregate of all the individual celestial spheres, it only confers itself as a power to occupy a space and therefore cannot be considered as a synthesis of matter form.

More specifically, heaven must be considered as a three-dimensional corpus, existing as a middle nature between the world of intelligibles and

the sublunary forms characterized by generation and corruption.

Vernia concludes that heaven, as in the tradition that starts from the Chaldeans, passes through Aristotle and arrives in his time, is not generated, incorruptible and eternal, that is without a beginning and an end, and, as a consequence, there is no creation nor a final judgment as in the Christian perspective.

The *Quaestio de divisione philosophiae* (Vernia 1482a, cc. 2r–3v) is completed in 1482, as it is appended by Nicoletto Vernia to the *Quaestio an medicina nobilior atque praestantior sit iure civili* (Vernia 1482b, cc. 3v–5r), which, in turn, he completed on February 26, 1482, and published in the edition of the *Expositio* of Walter Burley to the Eight Books of *Physics* of Aristotle, edited by Vernia, which is printed on April 15, 1482, in Venice by Johann Herbart.

Vernia, on the basis of the threefold distinction of the sciences in theoretical, practical, and *poietical*, engages in an interesting discussion on the classification of the sciences and *artes* of his time. While practical disciplines, called *activae*, are orthodoxly divided into ethics, politics, and economics, the *poietical* disciplines, called *factivae*, have interesting distinctions. Medicine, for example, although being so close to *philosophia naturalis*, which, of course, is part of the theoretical sciences, is considered an integral part of the *factivae* disciplines because of the simultaneous presence of theory and *ars* within it.

The important fact is that precisely this simultaneous presence of theory and *ars* within a given activity will be considered one of the most important factors in the birth of modern science.

Even when Vernia speaks of the division of theoretical sciences, he provides interesting information typical of the way of understanding philosophy in general and Aristotelianism, especially during the second half of the fifteenth century. Theoretical sciences are therefore divided into three parts: *philosophia naturalis*, mathematics, and metaphysics, called *scientia divina*.

But even mathematics reserves surprises when the four traditional sciences associated with it, namely, geometry, arithmetic, astronomy, and music, are found united with perspective.

This discipline in the second half of the fifteenth century is becoming more and more affirmed but will have developed entirely at the height of the Renaissance.

Quaestio an medicina nobilior atque praestantior sit iure civili (Vernia 1482b, cc. 3v–5r) is part of the wider “dispute of the arts” of the fifteenth century. Nicoletto Vernia obviously sides with the superiority of medicine but that which is original in his theory is the fact that his opinion has a methodical foundation and tends to return to the original teachings of Aristotle.

The first aspect taken into consideration is the use of the demonstration. Vernia establishes a ranking of the nobility of the disciplines based on the use they make of the demonstration; he, in fact, is the first to argue that the criterion of classification must be that of scientific trust.

It is obvious that the physical sciences in this have primacy because they use the demonstration in a completely constitutive way. Medicine also uses both *demonstratio quia* and *demonstratio propter quid*. The inferiority of jurists depends, on the other hand, on the fact that they only use a particular field of logic that is dialectics and they do so also in a nonconscious and therefore unsystematic way.

The second aspect taken into consideration concerns the hierarchy within the sciences themselves, since each discipline derives its importance from the level covered by the one to which it is subordinate.

Medicine is subordinate to natural science, which plays a more prominent role than politics, which is subordinate to jurisprudence, and that is enough to make the practice of medicine much more valuable than the practice of law.

Precisely on this basis, Vernia founded the third aspect of the superiority of medical science over the juridical one as, while the politics, which is related to the jurisprudence, is limited to pursuing happiness within the civil community, the natural science to which medicine is bound, permits the knowledge of the highest essences allowing us to reach the sum of happiness that lies in the contemplation of the absolute.

In the same year 1482, the *Quaestio de inchoatione formarum* was also written. It has

remained unpublished and we only have in possession a handwritten copy of it with the following title *Quaeritur utrum sint ponendae rationes seminales in materia respectu rerum quae ex ipsa generantur*. This manuscript is preserved in the Vatican Library and is part of the Codice Urbinate Latino 1492, ff. 83v–85r.

This *quaestio* is very brief and the discussion that it deals with is about the role of universals, which is one of the main topics of interest of Vernia and to which he devotes a profound study that will lead to the *Quaestio an dentur universalia realia*.

In this work, he argues that the form operates even before arriving in the act according to the principle of *inchoatio formarum*, which determines not a change in the state of the substance but a certain inclination of the form to shape the matter.

On November 18, 1491, Vernia concludes his *Quaestio an coelum sit animatum*, which has remained unpublished. Alessandro Sermoneta made a transcription of it, which was, later published by Pietro Ragnisco (1890–1891a, 275–302).

Vernia discusses two topics concerning the perfection of the heavens and the quality of their motion.

With regard to the first argument, he says that if heaven had not a soul it would lack something that completes its essence and for this reason, it would be imperfect. Living beings, in fact, are more perfect than other beings precisely because they have a soul. The heavens, precisely because they must be considered absolutely perfect, must therefore also be considered endowed with a soul.

On the other hand, with regard to the subject of the quality of movement, it must be borne in mind that if the movement of the heavens is not violent, it must be determined either by the soul or by nature. The fact that the movement of the heavens is not violent is self-evident. The fact that the celestial movement is not a motion determined by nature is proved both by the observation that every natural movement ends when it reaches its place whereas the movement of the heavens is endless, and also by the fact that every natural movement has an increase and decrease while

the heavens move constantly. Consequently, the motion of the heavens is caused by their soul.

Nicoletto Vernia completed the *Quaestio est an dentur universalia realia* (Vernia 1492, cc. 2v–5v) on February 17, 1492.

He has a position that is intermediate between the two extremes of nominalism of William of Ockham and the realism of Walter Burley.

Vernia admits the existence of the universals by considering them in two distinct ways: in the first way, the universal is considered on the basis of itself; in the second way, the universal is considered on the basis of how it is realized in matter.

The first way includes, in turn, two different typologies: the first one is connected to the absolute essence of the universal that is not linked to its being present in matter; the second one is linked to its manifestation in particular things.

In this way, it is possible to affirm both the role of the universal as a common collector of meanings and the presence of the common essence in things belonging to the same species.

Vernia, between 1492 and 1495, also composed the *Expositio in Posteriorum librum priorem*, which remained unpublished and is now part of the Oxford manuscripts, Bodleian Library, Canon. Lat. Mix. 506, ff. 224r–241r.

This *expositio* has a particular relevance because it is an important testimony of an epochal transition both in theoretical and epistemological terms.

As is well known, in the second half of the fifteenth century, when the University of Padua became the leader in European scientific research, its professors achieved the overcoming of the epistemology of scholars known as *Calculatores*, who first taught in Paris and Oxford and then in Pavia.

The opposition to the epistemology of the *Calculatores*, many of which are close to the nominalistic position, is through the re-evaluation of Averroes' Commentary to Aristotle's *Posterior Analytics*. This task, already begun by Paolo Veneto and continued by Gaetano da Thiene, was completed by Nicoletto Vernia.

He, in fact, opposes the attempt to arrive only logically at the comprehension of all reality, both the simplest one, consisting of phenomena, and

the most complex one, constituted by the investigation of causes, which are examined by *Calculatores* on the basis of a calculation connected with the degrees of *intensio* and *remissio formarum*.

Vernia proposes, instead, the study of the Aristotelian *Organon* with the commentary of Averroes which indicates, instead, a scientific procedure based on demonstration.

The *Expositio*, in fact, tends to re-evaluate the centrality of scientific syllogism, whose pivotal point is the adoption of the cause of the phenomenon that we want to investigate as a medium term.

Inside the Oxford manuscript several *quaestiones* can be identified, such as *Quaestio utrum logica sit scientia*, *Quaestio est quae scientiarum sit prima ordine doctrinae, sive sit practica sive speculativa*, *Quaestio de minimis*, *Quaestio de causa virtutis secundum quod gravia et levia eorum locis appropinquantia velocius moventur*.

The most important *quaestio* is inside the *Expositio* and has the title *Quaestio de regressu*. It corresponds to the Commentary on Chapters 2 and 3 of Aristotle's first book of *Posterior Analytics*, in which the Stagirite points out that the true scientific process is only that which is based on knowledge of the cause. The entire methodological tradition developed at the University of Padua focuses on the possibility of attributing maximum certainty to the principles on which science is based. Natural science is, therefore, always conjectural and cannot aspire to the absolute certainty that comes from mathematical science. In the natural sciences, in fact, we must start from that which is best known to us, using induction, and then arrive at a universal statement. Perfect induction, however, can only be achieved when all cases occur or when, after some of them have been verified, it can be said that the conclusion that has been reached is true for every other individual.

Since natural research lacks such certainty, consequently the medium term on which the syllogism of its demonstrations is based is not really universal. This universality would be possible

only if the medium term were a cause attributable with absolute certainty to its effect, i.e., to the object of the observation.

The logical tradition of the University of Padua, on the other hand, pursues the ideal of conferring on natural research the same certainty that characterizes deductive sciences such as mathematics and for this reason, it seeks the possibility of connecting the inductive process, typical of natural sciences, questioned by conjecture, with the deductive process of mathematical sciences capable of guaranteeing the perfect connection of a given cause to a certain effect.

The possibility of connecting the *demonstratio quia*, which develops the inductive process, with the *demonstratio propter quid*, which develops the deductive process, takes on the name of *regressus demonstrativus*.

During the year 1499, Vernia completed his last and most famous work, the *Quaestiones de pluralitate intellectus contra falsam et ab omni veritate remotam opinionem Averrois et de animae felicitate* (Vernia 1504, cc. 2r–10r).

In order to understand the change of perspective in Vernia's thought, it is necessary to remember that on May 6, 1489, the bishop of Padua Pietro Barozzi, with an episcopal edict, warned the teachers of the University of Padua against discussing the subject of the immortality of the soul under threat of excommunication. From that moment begins a long phase of reflection in which Vernia's primary objective is to prove his adherence to the orthodoxy of the Catholic faith.

The aim of this *quaestio*, therefore, consists in demonstrating that his thought coincides with that of Albert the Great, Thomas Aquinas, and John Duns Scotus and that, as they proved, Aristotle's thought, if correctly interpreted, coincides entirely with the doctrine of the Catholic Church.

Vernia, in perfect conformity with the dictates of the Church, but in total divergence with his previous position on the subject, affirms that the intellectual soul is the substantial form of the human body, that it formally confers its existence, that it is intrinsic to every individual, and that it is infused by God in every man.

Vernia also asserts that the number of souls is equal to the number of individuals and that the soul is created by God and is not pre-existing in the body.

Also of great interest is Vernia's position toward the thought of Alexander of Aphrodisias, especially in view of the fact that the pupil of Vernia, Pietro Pomponazzi, will base on Alexander's thought the most important historical turning point on the treatment of the immortality of the soul present in Renaissance thought.

Pomponazzi, in fact, recognizes Alexander as the authentic interpreter of Aristotle's doctrine of the soul and therefore agrees with his interpretation according to which the soul is mortal. This causes one of the most famous discussions within the thought of the Renaissance with important political implications, given its clear opposition to the Church's thinking, based on the doctrine of Thomas Aquinas.

Nicoletto Vernia, in an astonishing way, uses philology this time to propose an interpretation that suggests that the thesis of the mortality of the soul comes from an erroneous understanding of Alexander of Aphrodisia's thought by Averroes, who had thus erroneously handed down the doctrine according to which the soul is mortal.

Averroes misinterpreted the thought of Alexander of Aphrodisia as he did not have a reliable text of his *De anima*. Averroes thus attributed to Alexander the thesis of the mortal nature of the human intellect mistakenly claiming that he spoke of this subject while Alexander spoke of the cognitive virtue that for him, as for all philosophers, is obviously mortal as the attitude to abstraction ends with the body being connected with materiality.

On these bases, Vernia affirms that Alexander of Aphrodisia believes that both the active intellect and the passive intellect are eternal and therefore that the soul is eternal.

On October 5, 1499, Nicoletto Vernia dies and is buried, according to his will, in Vicenza where he still lies.

It is difficult to reconstruct, however, the destiny of his library that, leaving aside the dispersion

of the texts sent to Pisa, mainly follows the destiny of the displacement of books removed, over the centuries, from the Library of the Convent of San Bartolomeo in Vicenza. That which is currently found is divided between funds available at the University Library of Padua, the Antonian Library of Padua, the Marciana Library of Venice, the National Library of Rome, the Vatican Library, the National Library of Paris, the British Library of London, and the Bodleian Library of Oxford.

The incunabula we have received are about twenty and among them are the most important texts of Albert the Great, John Duns Scotus, Walter Burley, John of Jandun, Gaetano of Thiene, Themistius, and Ermolao Barbaro.

The most important manuscripts contain writings by Giovanni Marliani, Gaetano of Thiene, Richard Swineshead, Giovanni de Arculis, Angelo of Fossombrone, Mesino de Codronchi, Dino del Garbo, Antonio of Imola, Hervaeus Natalis, Peter of Auvergne, William Heytesbury, Richard Kilvington, Walter Burley, Thomas Bradwardine, Roger Rosetus, Nicolas Oresme, Marsilio Santasofia, Biagio Pelacani, Jacopo of San Martino, Antonio of Conegliano, Gregorio of Rimini, and Giovanni of Casale.

Heritage and Rupture with the Tradition

As is known, the *Posterior Analytics* of Aristotle is the reference text of science throughout the period from the thirteenth to the seventeenth century, that is, until the advent of modern science.

Starting from the study of this text, Aristotelian epistemologists focus attention on scientific demonstration, which is that consisting of a syllogism that moves from universal and necessary premises, and tries to connect the inductive method with the deductive method.

They want to achieve, in fact, the connection between the scientific demonstrative syllogism that starts from the effects to return to the causes, named *demonstratio quia*, and the scientific demonstrative syllogism that starts from the causes to get down to the effects, named *demonstration propter quid*. In this way, a perfect

scientific method would be created that combines the analytical procedure with the synthetic one and thus manages to explain the totality of the cause–effect relations between phenomena.

Aristotle, however, not only never mentions the possibility of connecting, through syllogism, the inductive process with the deductive one, but also does not give preference to a certain modality of syllogism except on the basis of the typology of the object of the scientific investigation according to the criterion that prefers deductions in mathematical science and induction within the natural investigation.

During the fifteenth century, the University of Padua became one of the most important centers of scientific research. In this University, however, a methodology was used that is radically different from that based on *calculatoria* logic. The scholars of the University of Padua seek, in fact, a method more closely related to the actual reality of the objects of investigation, and this leads them to turn to the historical epistemological tradition that passes mainly through the reflection of Galen, Themistius, and Averroes.

In this way, they try to connect the *demonstratio quia* and the *demonstratio propter quid*, obtaining an original epistemological instrument destined for a centuries-old fortune, whose name is *regressus demonstrativus*.

The first scholar at the University of Padua to elaborate on the theory of *regressus* is Paolo Veneto. He, however, supports the theory of the priority of the *demonstratio quia* within the *regressus*, and this position characterizes the speculation of his successors right up to Vernia. Paolo Veneto emphasizes the fact that the *quia* process, which follows the *prius nobis*, i.e., that which is present first to knowledge, is so inherent to our way of knowing that it is through the *demonstratio quia* that we are able to acquire the notions of cause and effect. These notions are those we use as predicates to attribute to the data we investigate in order to establish the order in which they should be placed. Veneto underlines, therefore, that such data would remain without the cause–effect connection, which characterizes its scientificity, if such notions of

cause and effect did not come directly from the activity of *demonstratio quia*, to which the *demonstratio propter quid* owes everything in regard to the certainty of its results.

The idea of the superiority of the inductive phase in the cognitive process remains the most followed until Nicoletto Vernia's speculation. He proposes, instead, for the first time the thesis of the superiority of *demonstratio propter quid*, that is of the deductive process, destined to characterize all subsequent logical theories.

Innovative and Original Aspects

Vernia is also the first theorist of the *regressus demonstrativus* at the University of Padua, given that, on the one hand, he frontally opposes those who consider the circular demonstration logically impossible, and on the other hand, he argues that not only is the circular demonstration possible but that it must use both inductive and deductive syllogism at the same time.

He is, therefore, the first supporter of the possibility of creating a virtuous and not tautological circle using two syllogisms: the first syllogism realizes the analytical process of ascending from empirical data to the first universal knowledge of the cause, while the second syllogism realizes the synthetic process with which scientific knowledge is perfected by verifying the belonging of the cause to its particular effect.

In this perspective, it is necessary both to reduce the priority of the *demonstratio quia* and to revalue the *demonstratio propter quid*, whose role of going down again from causes to effects represents for Vernia the true guarantee of scientificity because it leads to the same level of certainty proposed by natural causation.

He is also the first to propose the figure of the *negotatio intellectus*, which is a third phase that follows the *demonstratio quia* and precedes *demonstratio propter quid*. In this phase, the *inventio intellectus* takes place, which is a process whereby the cause, which after the use of inductive syllogism is still at the phase of simple

hypothesis, becomes an epistemic certainty that guarantees the certainty of the cause–effect relationship, then further confirmed by the subsequent deductive syllogism.

Impact and Legacy

It is important to remember that, in the case of *negotiatio intellectus*, Nicoletto Vernia is the first proponent of a methodological innovation destined to be successful until the speculation of Iacopo Zabarella and the early methodological theories of Galileo Galilei.

Ultimately, it can be affirmed that, thanks to the first and original introduction of the methodological innovations constituted by the priority of the *demonstratio propter quid*, by the *negotiatio intellectus*, and by the first complete theorization of the *regressus demonstrativus*, Vernia represents the leader of innovations destined to indelibly mark the logic of the whole fifteenth and sixteenth century until the dawn of the modern age.

Abstract

Johannes Versoris (probably died after 1482) was a Master of Arts active at the University of Paris in the fifteenth century. He wrote a number of influential commentaries on the *corpus Aristotelicum*, Peter of Spain's *Summulae logicales*, and Thomas Aquinas's *De ente et essentia* which were frequently reprinted between 1480 and 1500, especially in Cologne. Since Versoris's commentary work bears traces of both Thomist and Albertist thought, the question of his relation to the contemporary schools of thought is highly controversial and as yet unresolved.

Alternate Names

Versor, Johannes; Versorius, Johannes; Le Tourneur, Jean

Biography

Little is known about the life of Johannes Versoris, a realist philosopher and celebrated commentator on Aristotle who taught at the University of Paris during the fifteenth century. Although generally called “Versor” in the scholarly literature, there is some evidence that his actual name might have been “Versoris” (that is, “son of Versor” or Le Tourneur) – at least that is how he is referred to in Parisian documents of the time, and this spelling also appears on his (undated) epitaph. The name Versoris first crops

up in 1435, when he is mentioned as a Master of Arts in a document pertaining to the Norman nation (*natio Normannorum*) of the University of Paris. Since at Paris students were supposed to have reached the age of twenty before the title of *magister artium* could be conferred, it is reasonable to conjecture that Versoris was born around 1410. In 1449 the Arts Faculty proposed him as rector of the Paris *studium*, but he refused the post; when in 1458 his name was put forward again, this time he accepted. Information on the activities and whereabouts of Versoris after his rectorate is scarce: it is only in 1478 that the Paris documents again mention a certain Johannes Versoris, who, however, is referred to as a Master of Arts not in the *natio Normannorum* but in the *natio Picardorum*, the Picardian nation. It is not impossible, nevertheless, that these notices concern one and the same person – and scholars generally assume that they do – although this cannot be proven. If this identification is correct, Versoris probably spent his entire career teaching at the Paris Arts Faculty and may have died after 1482, as the last reference to the Picardian Versoris occurs in this year.

As part of his teaching activity at Paris, Versoris composed commentaries on nearly the entire Aristotelian corpus (although the attribution of some commentaries is problematic, *pace* Flüeler 1994: 80–84), the *Summulae logicales* by the thirteenth-century logician Peter of Spain (Versoris 1981) and Thomas Aquinas's *De ente et essentia* (Versoris 1486) – in total, his writings are preserved in some 180 manuscripts (Seńko 1958/1959). Versoris is also said to have been the author of a commentary on the *Ars minor* by the ancient grammarian Donatus, although this attribution is probably spurious (Kneepkens 2004; Versoris 1489). His expositions of Aristotle enjoyed a certain popularity at the university in Paris, from where they spread to Cologne, Prague, and Cracow during the second half of the fifteenth century (Markowski 1968; Kuksewicz 1973; Šmahel 1980). All of his commentaries were printed multiple times before the turn of the century, mostly in Cologne (Rhodes 1970; Lohr 1971: 290–299). Risse (1965: 282) counted 23 editions of his commentary on Peter of Spain between 1473 and

1639, which makes Versoris “the most popular commentator” on Peter’s *Summulae* of the era (Ashworth 2008: 621). His questions on Aristotle’s physical works and Thomas’s *De ente et essentia* were even translated into Hebrew by the Spanish Jewish scholastic Eli Habillo in the course of the 1470s (Rothschild 1994).

It is unclear whether Versoris ever held a position at the University of Cologne. Despite lack of proof, older studies generally assume that he did (De Wulf 1925; Meersseman 1935; Weiler 1962). Yet his name does not appear in the acts or matriculation lists of the university (Weijers 2003), and contemporaries consistently refer to Versoris as a Parisian scholar (*Parisiensis*). It seems unlikely, therefore, that he was ever actively engaged in teaching at one of the Cologne *bursae*, although it has been suggested that he was on good terms with the Cologne Masters of Arts, especially those affiliated to the Thomist *Bursa Cornelianiana* and *Bursa Montana* (Meuthen 1988: 185; Tewes 1993: 189–190). This could account for the fact that Versoris’s commentaries on Aristotle and Peter of Spain were printed no fewer than thirty times in Cologne during the 1480s and 1490s (Corsten 1981). It has also been suggested, moreover, that sometime during the heydays of his academic career, Versoris stayed in the Iberian peninsula. This hypothesis, though controversial, could account for the fact that the aforementioned Spaniard ‘Eli Habillo in the preface to his translation of Versoris’s commentary on the *Physics* refers to the Parisian scholar’s name in such a familiar wording that it suggests a personal acquaintance. Moreover, in the Hebrew chronic *Shebet Yehudah* (c. 1510), one finds the curious reference to a certain king Alfonso (possibly Alfonso V, King of Portugal between 1438 and 1481, or Alfonso V, King of Aragon between 1416 and 1458) who addressed a series of questions on the trustworthiness of Jews to a savant called Weyrśōrīs. Given the present state of our knowledge of Versoris’s life, it is impossible to determine whether this reference actually concerns our Parisian philosopher or not. Whatever the case, Versoris’s commentaries were well known in this part of Europe, and the numerous manuscripts of Versoris’s works that are still

preserved in Spanish libraries today testify to this popularity (Rothschild 2013: 309–314).

Philosophy

A fifteenth-century Master of Arts, Versoris taught during a period that was marked by the formation of the so-called schools of thought. In Versoris’s Parisian setting, Thomism flourished and Albertism was gaining influence under the impulse of Johannes de Nova Domo (†1418), while nominalism was in decline (eventually to be banned by a royal decree in 1474). Given this predominantly realist milieu, it is hardly surprising that Versoris set himself up as a proponent of the *via antiqua*, the realist school of thought associated with followers of Thomas and Albert. Yet the question of which type of realist philosophy Versoris adhered to (and especially his predilection for Thomism or Albertism) is a controversial one. Ever since Prantl (1870: 220–221), Versoris has generally been regarded as a Thomist philosopher and logician, although it seems closer to the truth and more in accordance with contemporary testimonies to characterize him as an eclectic thinker – indeed, his pupil Dominique of Flanders may have listed him among the adherents of Thomism, but he added that Versoris occasionally embraced the teachings of Albert the Great (*sed Albertizabat* – see Mahieu 1942: 22; Lohr 1971: 290). Matters are further complicated by the fact that Versoris himself, unlike many of his contemporaries (such as Heymeric de Campo or Arnold of Tongeren, two convinced Albertists), never explicitly expressed his loyalty to either Thomas or Albert. As regards his ideas on physics and moral philosophy (see Versoris 1484, 1967a), there is consensus that Versoris was heavily indebted to Thomas (Birkenmajer 1925; Sère 2007; Saarinen 2011; Müller 2016). This also holds true for his interpretation of the *Metaphysics* (Versoris 1967b; Bakker 2014). The situation is less clear, however, in his commentaries on the *Organon* (Versoris 1967c, 1967d). Bos (2002) emphasized Versoris’s Albertism in his questions on the *Categories*; Rutten (2005: 323), mainly on the basis of Versoris’s explanations of the *logica*

vetus, described his doctrinal profile as “indistinct and at best a blurred form of Thomism” and insisted that in his own time he was seen as an authority in his own right rather than a representative of either movement. This is in line with the interpretation by Krause (1991: 520), who suggested the possibility of “Versorism” as a distinctive subcurrent of Thomism.

It can easily be seen why the question of Versoris’s relation to Albert and Thomas causes so many difficulties, since Versoris’s balancing of the interpretations of both realist philosophers may be considered a guiding thread leading through his oeuvre, and on different occasions, he appears to align himself quite randomly with either of them. The following examples may suffice to demonstrate this point. In his commentary on the *Isagoge*, Versoris (1967d: f. 21r-v) briefly touches upon the problem of incipient forms (*inchoatio formae*), a question related to Aristotle’s discussion of the principles of form, matter, and privation (see *Physics* I.9, 192a16-34). Briefly put, the problem of *inchoatio formae* concerns the question of whether or not matter contains some innate aptitude for receiving a particular form. Albert answered this question in the positive, Thomas in the negative. Versoris himself closely paraphrases Albert’s text and merely points out that Thomas held a different opinion. However, when discussing the same issue in his commentary on the *Physics*, Versoris rejects Albert’s view in favor of the opinion held by Thomas (see Rutten 2005: 304–312 for discussion). The same pattern can be discerned in Versoris’s account of substance and being, as expressed mainly in his commentaries on the *logica vetus* and Thomas’s *De ente et essentia*. As regards the notion of substance, discussed in his commentary on the *Categories* (Versoris 1967d: f. 30r), Versoris embraces the explanation of Albert that this term entails a threefold meaning: (a) the metaphysical notion of essence, (b) the logical notion of the first thing predicable, and (c) individual substance (Bos 2002: 71–73). Furthermore, in his commentary on the *Isagoge*, he equally agrees with Albert when he claims that a universal should be understood in terms of the *forma totius* and has, moreover, a threefold mode

of being: *ante rem*, *in re*, and *post rem* (Versoris 1967d: ff. 7v-14r; Rutten 2007: 129–132). However, when Versoris, in his commentary on *De ente et essentia* (Versoris 1486: sig. D5v), discusses the notion of being (*esse*) as composed of essence (*esse essentiae*) and existence (*esse existentiae*), he aligns himself with the interpretation of St. Thomas that actual existence really (*realiter*) differs from essence and merely notes that Albert holds the opposite opinion (Riesco Terrero 1966; Krause 1991: 510). As regards the principle of individuation, which is also discussed in the commentary on *De ente et essentia* (Versoris 1486: sig. D1v), Versoris agrees with Thomas that signate matter accounts for the numerical distinction of corporeal substances; he rejects the opinions held by Giles of Rome and Albert, who explained individuation in terms of quantity and matter respectively (Krause 1991: 514–515; Rutten 2005: 316–319).

As a possible solution to the problem of Versoris’s doctrinal inclination, Rutten (2005: 319–324) suggested that Versoris’s predilection for either Albert or Thomas is related to the specific work he was commenting on. In the case of the *Isagoge* or *Categories*, for example, he had no choice but to follow Albert, since Thomas never composed a commentary on these works. When he did have a choice, however, it appears that he decidedly embraced the interpretations of the *doctor angelicus* (see the examples from the *Physics* or *De ente et essentia* explained above). This could also account for the fact that, when Versoris paraphrases the explanations of Albert and notes a difference of opinion between Albert and Thomas, he never proves Thomas wrong – in some instances he even refers to the opinion held by the *Albertistae*, which implies that he did not consider himself as one of them (Rutten 2005: 314).

Since Versoris was a university teacher whose entire oeuvre consists of questions, paraphrases, and summaries of school authors, the question of the originality of his thought is perhaps not the correct one to ask. Medieval or early modern school teachers were not supposed to be original. Rather, they were supposed to explain the texts prescribed by the university statutes and render

these texts intelligible by making use of a fixed set of commentators who were considered authoritative. Versoris's popularity, therefore, was not based on the fact that his commentaries contained some original insights into, or elaborations on, the matter he explained (although in some cases they do, see Bakker 2014: 611–612), but instead on his ability to present interpretations excerpted from the great philosophers of previous ages in a synoptic, lucid, and accessible way. As a compiler and interpreter, Versoris was, together with the Scotist Petrus Tartaretus and the nominalist George of Brussels, one of the most successful of his time.

Vesalius, Andreas

Born: 1514, Brussels

Died: 1564, Zákynthos

Frances M. Gage

Buffalo State – The State University of New York,
Buffalo, NY, USA

Abstract

Andreas Vesalius is the most renowned of Renaissance anatomists. After several stops and starts in his education, he took his Doctor of Medicine at the University of Padua where he quickly rose to prominence as a lecturer of surgery. His university career, though important in inspiring both contemporaries and

subsequent generations of anatomists, was relatively brief, lasting from 1537 to 1543. Even before the publication of his widely celebrated *De humani corporis fabrica* (1543), Vesalius was appointed Imperial physician to Charles V and he achieved some fame as a surgeon. Traditionally described as a major reformer of the field, even one who revolutionized anatomy, Vesalius's research actually continued some of the innovations of earlier Renaissance anatomists, namely in stressing the importance of dissection and in criticizing Galen. On a deeper level, his approach remained fundamentally Galenic, though he revealed that Galen had relied upon animal dissecting in writing about human anatomy. Vesalius stressed that human anatomy required human dissection, but Vesalius, too, performed animal dissections and comparative anatomy. Although he was invited to return to his academic post and may have wished to do so, he died on the return trip from a pilgrimage to the Holy Land in 1564. His work confirms the close relationship between Renaissance anatomy and natural philosophy (Mandressi 2003; Vesalius 2014).

Biography

Vesalius was born into a medical family; his father was an apothecary to Charles V. Initially educated in Brussels, Vesalius entered the Castle School in Louvain in 1530, where he studied Latin and Greek, philosophy, and rhetoric, before transferring to the University of Paris in 1533. There Galenism increasingly dominated medical teaching and his mentors included Guinter of Andernach, Jean Fernel, and Jacopus Sylvius, the latter a staunch defender of Galen's infallibility. Sylvius would later become Vesalius's enemy in polemics over Galen. Vesalius would nevertheless acknowledge his indebtedness to his teachers in Paris although he did not complete his degree there (O'Malley 1964). He left off his studies in 1536 and returned to Louvain, owing to the war between France and the Empire.

The following year he enrolled at the University of Padua, which held one of the leading European medical faculties at the time, and was awarded the degree of Doctor of Medicine in the same year. He was immediately appointed lecturer in surgery at Padua. Shortly thereafter, Vesalius began anatomical demonstrations, fulfilling simultaneously roles that had hitherto been distinct – those of lecturer, dissector and demonstrator – in which the lecturer traditionally sat in a raised seat explicating an authoritative text while barber-surgeons performed the dissection. In the frontispiece and author portrait of the *Fabrica*, both represent Vesalius in the act of dissecting; indeed, he would argue that the barber-surgeons who conventionally performed the dissection should be sent away (O'Malley 1964). Vesalius also began to think about pedagogical aids, and he produced detailed anatomical drawings, three of which were published in his *Tabulae anatomicae* of 1538 (Vesalius 1538). This text also included anatomical figures by Jan Stephan van Calcar, generally held to have been the artist of the *Fabrica*, though no definitive evidence has ever come to light (O'Malley 1964; Vesalius 2014).

The direct experience Vesalius earned through his dissections increasingly called his attention to Galen's errors, and by 1539, having produced several minor publications, Vesalius began outlining his *Fabrica* (O'Malley 1964). Developments over the next few years were crucial in permitting him to complete his treatise. The support of the judge Marcantonio Contarini assured Vesalius of more cadavers for dissections at a juncture in which he did not practice privately and could not rely on the experience yielded by consulting patients (O'Malley 1964; Park 2006). At the same time, his reputation in medical circles grew, bringing opportunities to lecture outside Padua; these occasions disseminated more broadly his outspoken criticism of Galen's inaccuracies resulting from his dependence on animal dissection when writing on human anatomy (O'Malley 1964).

Vesalius concentrated energetically on the *Fabrica* in 1540–1541 and in the following year left Padua for Basel to supervise the treatise's publication (O'Malley 1964). In 1543 while awaiting the volume's publication, Vesalius, who had applied

for an imperial post, was named physician to the imperial household and he left his university chair. In service to the Emperor, however, Vesalius seems not to have been wholly satisfied and he sometimes lamented his obligations (O'Malley 1964). He evidently strove to continue his anatomical research as much as he could, acting as a military surgeon and accepting invitations to provide demonstrations. In 1546, Vesalius published his letter on the therapeutic effects of the China Root, which also continued the polemics concerning the appropriate use of Galen (Vesalius 1546). His experience as a surgeon contributed to his fame, and in 1559, he was even called to the bedside of the fatally wounded King Henry II, in spite of the presence of the esteemed royal surgeon Ambroise Paré. Notwithstanding his acclaim, Vesalius increasingly acknowledged that the *Fabrica* contained errors and he embarked on a second edition with his publisher Oporinus, probably completing many of the revisions in 1550–1551. The second edition was published in 1555, the same year that Charles V abdicated (Vesalius 1555). Vesalius then entered the service of Charles' son, Philip II, as a physician to the Netherlands at the Spanish court. He was granted leave by the emperor to complete a pilgrimage to Jerusalem in 1564 and en route stopped in Venice, where he was invited to resume his university post at Padua. This never materialized, for, on his return trip from the Holy Land, his ship encountered a storm and anchored at Zákynthos, where Vesalius died.

Vesalius' stance with respect to Galen is complicated and is still sometimes mischaracterized. If he pointed out many of Galen's errors, Vesalius's methods were fundamentally Galenic in nature, particularly in stressing the importance of dissection, the fundamental role of touch and observation, and the necessity of repeat dissections in order to provide certainty (O'Malley 1964; Cunningham 1997; Siraisi 1997; Mandressi 2003; Vesalius 2014). Vesalius' crucial criticism of Galen lay in the latter's use of animal dissection to write human anatomy, which Vesalius insisted must be founded upon human dissection (Mandressi 2003; Vesalius 2014). In a period of a limited supply of human cadavers, Vesalius nevertheless also relied

extensively on animals and frequently undertook comparative human/animal anatomies (O'Malley 1964; Cunningham 1997).

Although the achievement of Vesalius's *Fabrica* in providing exhaustive textual and visual descriptions of the body can hardly be overstated and the *Fabrica*'s role in stimulating anatomical research and elevating the status of anatomy in medical study is certain, Vesalius was neither the first Renaissance anatomist to recognize the importance of images in anatomical texts nor to underscore the direct observation of the human body. In both respects, he continued the interests of his predecessors (O'Malley 1964; French 1999; Carlino 1999; Mandressi 2003). Even if the *Fabrica* was not without errors, as Vesalius' contemporaries and successors were keen to point out, the scope of it and the quality and number of its images found no rivals for decades, and his illustrations were widely plagiarized. At the same time that Vesalius asserted the importance of dissection, encouraging students to dissect as well as to see and touch the body (O'Malley 1964; Cunningham 1997; Park 2006), he maintained allegiance to humanist medicine in his attention to the linguistic problems of anatomy and particularly in nomenclature, making reference to Latin and to a lesser extent, Greek, Hebrew, and Arabic terms and he would have expected readers of the *Fabrica* to know the authoritative texts. (O'Malley 1964; Siraisi 1997).

Rather than simply describe and illustrate the process of dissection in his *Fabrica*, Vesalius broke new ground by focusing on the structure and composition of the body, commencing in Books I and II of the *Fabrica* with the skeleton and bones and muscles and ligaments respectively, but here he harkened back to Galen's view that the bones were the body's foundation (Mandressi 2003). This interest in the fundamental principles of nature demonstrates his view that anatomy was inextricably related to natural philosophy; anatomy was an investigation of nature's parts and her workings (Park 2006; Vesalius 2014). His research helped ensure that anatomy would assume a fundamental place in medical education by the seventeenth century (O'Malley 1970).

Vettori, Piero

Born: July 1499, Florence

Died: December 1585, Florence

Eric MacPhail

French and Italian, Indiana University,
Bloomington, IN, USA

Abstract

The last of the great Florentine humanists, Piero Vettori made his mark on a golden age of classical scholarship in the Florence of Grand Duke Cosimo I. Vettori rose to prominence in public and professional life as a scholar, orator, ambassador, and teacher, serving as professor of Greek at the Florentine Studio for over 45 years. In his scholarly career, Vettori concentrated primarily on the restoration and conservation of the classical heritage through careful study of the manuscript tradition. Such study allowed him to resurrect lost works from oblivion, including Aeschylus' tragedy *Agamemnon*. Vettori's work as editor and commentator entitles him to a distinguished place in the Aristotelian tradition, and he can truly be said to have exemplified the Renaissance ideal of the alliance of philology and philosophy. Last but not least, Vettori was a crucial figure in the Sophistic Renaissance, of which much more remains to be said.

Alternate Names

[Victorius, Petrus](#)

Biography

Born to a prominent Florentine family at the very end of the fifteenth century, Piero Vettori was educated in Florence and Pisa as a humanist and more particularly a Hellenist, by disciples of Francesco Filelfo and Angelo Poliziano, before inaugurating his own long and successful

academic career at the Florentine Studio. Married at a young age, Vettori raised a family of two children and earned a number of accolades both civic and scholarly while playing the part first of an ardent Republican and then an ally of the Medici regime. When the Medici were expelled and the Florentine Republic reestablished in 1527, Vettori, profiting from family connections, was named ambassador and later Gonfaloniere and even delivered a public oration to the Florentine militia, which did not have much practical impact on the unequal military contest (von Albertini 1955, 404–411). The Medici were restored to power in Florence in 1530, and Vettori discreetly retired to the family property in San Casciano in Val di Pesa, where Machiavelli had passed a part of his exile after the fall of the first Florentine Republic. He quickly returned to Florence and maintained a low profile during the reign of Alessandro de' Medici or Lorenzaccio, whose assassination in 1537 brought Cosimo de' Medici to power as Grand Duke of Tuscany, partly through the machinations of Piero's older cousin Francesco Vettori, famous as a correspondent of Machiavelli. In 1538 Piero Vettori was named to the chair of Greek newly established by Cosimo at the Florentine Studio where he taught until 1584, providing one of the best arguments against a mandatory retirement age at the university. Cosimo favored Vettori with various appointments, naming him to an embassy to Pope Julius III in 1550 before appointing him in 1553 to the Florentine Senate known as the *Quarantotto* or 48. Cosimo also named Vettori to his Council of the Two Hundred. Already in 1541, Vettori was admitted to the Florentine Academy, the very year of its foundation. In his scholarly career, Vettori distinguished himself as an editor and commentator of classical texts while the Medici family kept him busy as a funeral orator, especially at the funeral of Grand Duke Cosimo in 1574 (Mouren 2014). During his maturity, Vettori conducted an important correspondence in Latin and the vernacular with many distinguished Italian men of letters, including Benedetto Varchi, Giovanni Della Casa, and Fulvio Orsini (Lo Re 2006, de Nolz 1889). Only partially edited, this extensive correspondence offers precious source material for the intellectual history of the later or

second Renaissance. Vettori also made a valid contribution to the thriving genre of the Renaissance miscellany with his 38 books of *Variae lectiones*, of which the first 25 were published in 1553 and the remaining 13 in 1568 (Mouren 2001). Worn out by his labors, Vettori died at the end of 1585, and in January of 1586, the Florentine Academy staged an elaborate funeral ceremony at the Church of Santo Spirito which confirmed his status as civic hero and luminary of the Republic of Letters. After his death, Vettori's books and papers ended up at the Bavarian State Library in Munich where they await the intrepid researcher today (Pfeiffer 1976, 139).

Heritage and Rupture with Tradition

Vettori's greatest achievement was his contribution to the development of textual criticism, which has earned him an honorable place in the history of classical scholarship, not to mention the *History of Classical Scholarship* by Rudolf Pfeiffer and the earlier work of the same title by John Sandys, who christens the sixteenth century the *saeculum Victorianum* or Age of Vettori (Sandys 1921, 2:135; Pfeiffer 1976, 135–136). For Jill Kraye and Anthony Grafton, Vettori came to prominence by exploiting the methods of textual criticism pioneered by Angelo Poliziano, especially the careful collation of manuscripts necessary to identify the earliest extant witness and to eliminate unwarranted emendations perpetrated by overconfident editors (Grafton 1983, Kraye 1999). Like Poliziano, Vettori is keenly attentive to the Greek sources of Latin wisdom and eloquence. Vettori first applied these Florentine methods of philology to his edition of the complete works of Cicero, which appeared in four volumes from 1534 to 1537 with the Giunti in Venice. His most notable contribution to this enterprise was his appendix of critical notes explaining his corrections to the text. Among his other philological triumphs was his work on the Attic tragedians, especially Aeschylus and Euripides. In 1545 he published the *editio princeps* of Euripides' *Electra* in Rome, and in 1557 his edition of Aeschylus with Henri Estienne restored the mutilated text of the *Agamemnon* to its full length

(Pfeiffer 1976, 111). In this way, Vettori realized Poliziano's ideal of the humanist as Aesculapius, who restores the lost integrity of damaged texts just as the god of medicine put back together the dismembered corpse of Hippolytus.

Innovative and Original Aspects

The history of philosophy will remember Vettori as an Aristotelian and more particularly as a commentator of Aristotle. He published commentaries on the *Rhetoric*, the *Poetics*, the *Politics*, and the *Nicomachean Ethics*, and all four of these works can still greatly facilitate the comprehension of Aristotelian doctrine. Vettori draws on a comprehensive knowledge of the *corpus Aristotelicum* and indeed of the entire classical canon in order to explore exegetical issues that are largely foreign to the scholastic commentary tradition. His comments are lexical, historical, and genealogical but also lucid and ironic. One area where his originality stands out is the revival of interest in the ancient Greek sophists in Renaissance Europe, which was largely tributary to the reception of Plato and Aristotle (MacPhail 2011). One of the key passages for the reception of sophistic is the definition of the sophist from the very first chapter of Aristotle's *Rhetoric*. Having acknowledged that rhetoric entails an ability to argue on both sides of a question, or to persuade opposites (1355a29), Aristotle is at pains to distinguish rhetoric from sophistic, to which it bears an unseemly resemblance. He operates this segregation of rhetoric from sophistic on the basis of the distinction between *dynamis* and *proairesis* or ability and purpose (1355b18). The rhetor like the sophist is able to use true and false arguments, or true and apparent persuasion, but the sophist chooses to deceive. Rhetoric like dialectic may be amoral, able to use true and false means, but sophistic is immoral, not to say perverse. In his commentary of 1548, which remained the most important contribution on the *Rhetoric* until the work of Spengel and Cope in the latter half of the nineteenth century, Vettori draws on his formidable knowledge of Aristotle in order to link this passage in the *Rhetoric* to other uses of the pair *dynamis-proairesis*. First, he points out that Aristotle uses

the same terminology to characterize the ἀλαζών or boaster in book four of the *Nicomachean Ethics* (Vettori 1548, 24). Boastfulness and false modesty are the two extremes that diverge from the mean of truthfulness, so the *alazon* is also a type of liar. The worst boaster is the one who does so for the sake of gain, since the boaster is defined not by his ability but by his purpose (1127b14). By invoking this testimony, Vettori conflates sophist and *alazon* in order to yield the stereotype of the mercenary boaster. He also refers us to the passage in book Γ of the *Metaphysics* which says that the sophist differs from the philosopher on the basis of his choice of life, or "electione vitae" in Vettori's Latin. Through these cross references, Vettori identifies the definition of the sophist in *Rhetoric* 1.1 as a key tenet of Aristotle's philosophical system.

Vettori is also keenly sensitive to those moments when Aristotle betrays his own sophistic instincts. In the *Rhetoric*, when discussing fallacious enthymemes, Aristotle reminds us that making the weaker argument stronger was the characteristic trick of the sophist Protagoras of Abdera (1402a24). Vettori, whose commentary lingered indignantly over this passage (Vettori 1548, 439–440), remembers it when he explicates the *Nicomachean Ethics* at the very end of his career. In the latter work, Aristotle reports the remarkable argument which Eudoxus of Cnidus used to prefer pleasure to all other goods. Pleasure is not praised and therefore must be superior to those things which are praised, just like God and the good (1101b28–30). Vettori's comment is quite cunning: "and seeing that no one praised pleasure, he ingeniously proclaimed that the very same argument which his adversaries used to disparage it actually proved the nobility of pleasure, as we learn from Aristotle, who clearly seems to have recognized and enjoyed the elegance of this reasoning" (Vettori 1584, 61). This comment helps us to understand the elegant simplicity of Eudoxus' surprising argument. Rather than refute his adversaries, he reverses their logic. This is a classic example of making the weaker argument the stronger: pleasure is superior for the very same reason for which we think it is inferior. Both Aristotle and Vettori seem to approve this reasoning. Similarly, book two, chapter eight of the

Politics raises the question of whether it is advantageous or disadvantageous to cities to change their old laws if a better one is available (1268b26–28). Aristotle does not resolve this dilemma but is content to rehearse arguments on both sides of the question. In his commentary, Vettori recognizes this method as the sophistic tactic of antilogic or the art of opposing speeches: “He argues on both sides of the issue, and first he instructs and equips one who would approve this proposition [to change the laws]. . . Now he instructs and arms the other side and shows what can be said by others, who think that it is not right to change the laws, though they may not be entirely useful” (Vettori 1576, 135–138).

One of Aristotle’s arguments for changing the laws is that the original laws were made by primitive people emerging from one of the periodic cataclysms of the earth and it would be absurd to respect their decrees (*Politics* 1269a4–8). Vettori links this idea to the theme of the Renaissance: “He calls ‘the first men’ those who lived after some catastrophe, arising in a certain place or land, from a great flood, or pestilence, or some other disaster, so that it was necessary to regenerate the human race as if from the earth. Another opinion is that some people survived that destruction and gradually the population was replenished. In any event, the first people must have been very primitive. For who does not know that after the barbarian invasions of Italy and the fall of the Roman Empire, all the arts disappeared and only through tremendous effort and infinite study were the arts brought back to light and resuscitated as it were. This is clearly the case in the art of medicine, in painting, in agriculture, in military science and practically in all other disciplines” (Vettori 1576, 137). This Aristotelian adaptation of Renaissance self-consciousness can be understood as Vettori’s contribution to the philosophy of history.

Impact and Legacy

Apart from his place in the Aristotelian tradition, Vettori’s legacy can be felt in other domains. For instance, Torquato Tasso was a very careful reader of Vettori’s commentary on the *Poetics*, as we

know from his personally annotated copy now in the Vatican Library, and the influence of the commentary can be seen in Tasso’s *Discorsi* on the art of poetry and on the heroic poem (Vettori 2009; Scarpati 1982, 165–179). In the field of lexicography, the Accademia della Crusca consulted Vettori’s vernacular treatise on the cultivation of olives for the third edition of its Italian dictionary (Vettori 1574). In this way, the consummate Latin humanist contributed to the codification of vernacular usage. Vettori’s main impact remains in the realm of philology, where he left behind improved texts of an impressive array of classical Greek and Latin authors.

dignitate (*On the dignity of the republic*) dedicated to the papal legate at the Council of Trent, Cardinal Reginald Pole (1500–1558), wherein among others the famous humanist poet Marcantonio Flaminio (1497/98–1550) and Marco Girolamo Vida (ca. 1485–1566) are talking about the meaning and purpose of the state community during a hot summer day in 1545. Vida wanted his dialogue to serve as a replacement for Cicero's philosophical treatise *De re publica* (*The Republic*), which was lost in his day. In the dialogue *De rei publicae dignitate*, there are several allusions to Cicero's other philosophical treatises.

Abstract

This essay deals with Vida's life and his dialogue on political philosophy *De rei publicae*

Alternate Names

[Vida, Marcus Hieronymus](#); [Vida, Marcantonio](#)

Biography

Marcantonio Vida was born ca. 1485 in Cremona in Northern Italy to Guglielmo and Leona Ocasale. At a young age, he entered the order of the Canons Regular of the Lateran in San Pietro in Po in Cremona, in which he adopted the names Marco Girolamo (lat. Marcus Hieronymus). After beginning his studies of philosophy, theology, and canon law in Cremona, he moved in 1510 to Rome to continue his studies and became a canon of St. John Lateran.

The first patron of Vida as a poet was the cardinal and diplomat Oliviero Carafa (1430–1511), famous for his support of artists, among them the painter Filippino Lippi and architect Donato Bramante. Vida belonged with his friends to the humanists' group gathered in the court of Marchioness Isabella d'Este, some of whose members occupied high positions in the Vatican, such as Jacopo Sadoletto, Paolo Giovio, Pietro Bembo, Janus Lascaris, Lilio Gregorio Giraldi, and Gian Matteo Giberti.

The didactic poems about silk cultivation *Bombyx*, and *Scacchia ludus* about the gods playing chess, which was later paraphrased by the great Polish Renaissance poet Jan

Kochanowski, brought him his major recognition and fame.

His next patron, Pope Leo X, found that Vida was able to write an epic about Jesus Christ's life – the *Christiad*, which he began to write ca. 1518. The six-book poem was published for the first time in 1535 and overshadowed another poem with a similar topic, namely *De partu Virginis* of Jacopo Sannazzaro.

The first collected edition of the poet's works was published in May 1527, days before the so-called *Sack of Rome* – the despoliation of Rome by Emperor Charles V's army troops on 6 May. This edition contained *Ars Poetica* – *Poetics*, which was dedicated to Francis, the son of French king Francis I, and *Bombyx*, and *Scacchia ludus*, together with *Hymns* and *Bucolics*.

His single treatise on moral philosophy, in two books, *De rei publicae dignitate* (*On the Dignity of the Republic*), written in dialogue form, was first published in 1556 in Cremona – the only edition in the Renaissance. We had to wait for the next editions until the eighteenth century, when the two collected editions of his works were published in 1731 in Padua and in 1732 in London. The last and fourth edition of the dialogue appeared in 2004 in Trier, edited, translated, and commented on by Peter Hibst.

Returning to Vida himself, in 1533 Pope Clement VII nominated the poet Bishop of Alba in Lombardy, so Vida took part in some sessions of the Council of Trent (1545–1563). We know about his last act as Bishop of Alba, namely that in July 1566 Vida went to his native Cremona to buy for the Cathedral of St. Lorenzo the picture of St. Lorenzo painted by Giulio Campi which he had ordered.

Shortly after his return to Alba, Marco Girolamo Vida died on 27 September 1566 and was buried in the same Cathedral.

Heritage and Rupture with the Tradition

According to Vida, the dialogue *De dignitate rei publicae* was to have completed the whole of Latin moral philosophy by providing the missing

part on the political philosophy, thus replacing with this dialogue Cicero's philosophical treatise *De re publica* (*The Republic*), which was lost in his day. Vida's aim is to make a synthesis of the Greek philosophy of the state and Christian doctrine; he judges it as his duty toward society to do so, as nothing he thought to be more useful than a presentation of the worth of the state to perfect the people morally. This is an echo of Cicero's opinion in *Tusculanae disputationes* (*Tusculan Disputations* 1,5) that philosophy was neglected in Latin literature until his time and that his mission was to restore its grandeur. Cicero emphasizes that he wants to establish Greek philosophy in Rome presenting the science in Latin which deals with the right way of living.

Vida wants to discuss the matter applied to his turbulent time, not just theoretically. A similar note can be found in Cicero's *Tusculan Disputations* (1,7) that philosophical problems grow from everyday life. It is interesting that Vida uses in his vivid dialogue a great many quotations from the *Tusculan Disputations*, which present the stylized dialogue between the student and the master, and have nothing in common with a dialogue between equal partners.

The scene of Vida's dialogue *De dignitate rei publicae* is presumably the Palazzo delle Albere at Trent, a suburban residence of Cristoforo Madruzzo, where Marco Girolamo Vida and the dedicatee – the last Roman Catholic Archbishop of Canterbury, Reginald Pole (1500–1558), the famous humanist poet Marcantonio Flaminio (1497/98–1550), the noble Venetian patrician Alvise Priuli an associate of Pole (sixteenth c.-1560), and the two future popes: cardinals Giovanni Maria Ciocchi del Monte (1487–1555) (Pope Julius III from 7 February 1550 to 23 March 1555) and Marcello Cervini degli Spanocchi (1501–1555) (Pope Marcellus II from 9 April 1555 to 1 May 1555) relaxed one evening in the summer of 1545 in the garden during a pause in the negotiations in the Council of Trent, talking about the meaning and purpose of the state community.

The construction of the dialogue is the “debate for and against” (lat. *disputatio in utramque partem*), so the essential point of the dialogue is

the statements of the two orators. The first one, Marcantonio Flaminio, gives a fiery speech against the state, and the second one, Marco Girolamo Vida, defends the idea of the state. Flaminio's main allegations are that the state is a disaster for mankind, promotes greed, and destroys the virtues. Justice existed only in the Golden Age, and the state causes justice to perish. The ideal state is a philosophical fiction, and the philosophers have aimed at governing the state themselves, perorating uselessly about virtue and duty without consideration of the vice and crime in the state. Flaminio speaks in favor of the universal world state, which is based on natural law.

Vida counters that a good and happy life is the specific aim of the state, that the relation between justice and the public welfare is a requirement for the existence of the state, and that the virtuousness and the morality of the citizens and the sovereigns enable them to achieve felicity in the state. Vida argues that political authority is in accordance with the intentions of God and nature so that there can be order in society. He assigns the Golden Age to the primary phase of every society, regarding gradual decadence as a natural process. The decayed state can be raised again by virtuous citizens. According to Vida, law, religion, and philosophy are the achievement of the growing development of human reason in the state community.

In this discussion, there is a very interesting point, namely that Flaminio's utopian idea of a return to an allegedly ideal primeval time cannot be taken seriously, but Vida cannot completely refute Flaminio's objections against the state. Referring to Cicero's dialogues, where the "debate for and against" takes place, Vida lets the reader feel free to judge which opinion is right. He does not force us to accept his own point of view, although his preference is clear. No rupture with tradition exists in Vida's work, and his aim was to invoke the classical tradition and to show his mastery in adapting the philosophical thought of one of the most influential thinkers synthesizing the Greek philosophy of the state.

Innovative and Original Aspects

Vida extracts a lot from Cicero's philosophical treatises, especially certain structural similarities of the dialogue can be observed, which are repeated in most of the dialogues. One example is the *topos* of a pleasant, secluded place. Cicero used the motive of a shadowed, cool place for the conversation where the guests can relax during the hot summer day from Plato's dialogue *Phaedrus*. The same motive was used by Vida, too, but he went further and made a direct allusion to the *Phaedrus* (230c), mentioning the chirp of the cicadas. Although he used the motive taken from this scene, he left unconsidered the other well-known details such as the running creek, shady trees, beautiful grass, and pleasant wind, so he shows his independence in his artistic remodeling of this motive.

The second example of Vida's creative reference to Cicero's dialogue is the use of the two testimonies of the lost *De re publica*. Vida had the possibility of extracting some material from *De re publica*, because he evidently used the testimony about *De re publica* from Augustine's *De civitate Dei* (*The City of God*, 2,21), which allowed him to know about the structure of the dialogue and one of the interlocutors, named Philus, who plays the role of somebody who acknowledged the injustice in the nature of the state, having emphasized at the same time that the presented point of view is not his own and should just serve to find the truth. The second obvious testimony is Lactantius' *Institutiones divinae* (*The Divine Institutes*, 5,16,2–5) about Carneades' argumentation that justice could be achieved only through a return to the old way of life. Creating his dialogue *De rei publicae dignitate*, Vida let these points of view be presented by one person, namely Flaminio.

The interesting historical fact is that the palimpsest of Cicero's *De re publica* with the great parts of the first and second book, some text of the third book, a little bit of text of the fourth and fifth book, and none of the sixth book, was not found by Angelo Mai, the prefect of the Vatican library, until 1819. In May 1822, Angelo Mai published Cicero's *De re publica* with an

extensive commentary. This does not mean that Vida's effort is wasted, for his dialogue allows us to observe the art of the Renaissance humanist, and his way of alluding to the classics, and at the same time the author's own craft.

Impact and Legacy

Vida was known mainly for his poems. The *Christiad* had a great influence on works such as Torquato Tasso's *Jerusalem Delivered* – the famous scene of the devils' council, John Milton's *Paradise Lost*, and Friedrich Gottlieb Klopstock's *The Messiah*.

The *Poetics* was very popular; from 1527 to the second half of the nineteenth century, 69 editions of this poem were published. It was considered that Vida's work was fundamental for the theory of Neolatin literature. His talent and *Poetics* were appreciated by Eobanus Hessus (1488–1540), who expressed his admiration in an epigram *In Poeticam Hieronymi Vidæ (On Poetry of Girolamo Vida)*, and by Julius Caesar Scaliger (1484–1558), who wrote in some passages of *Poetices libri septem (Seven Books on Poetry)* about Vida's works.

One of the greatest poets of British classicism, Alexander Pope (1688–1744), appreciated Vida's poetical work so much that he alluded in the *Essay of Criticism* to some lines from the *Poetics*, which he cited in the annotations, and describing the Renaissance he mentioned Vida, Pope Leo X, and the painter Raphael.

Denis Diderot (1713–1784) in the *Jacques le fataliste et son maître (Jacques the Fatalist and his Master)* lets Jacques' master judge the story told by the hostess, in which she presented a girl who was in sequence a prostitute, a false devotee, and a regretful wife, with this sentence: “Vous avez péché contre les règles d'Aristote, d'Horace, de Vida et de Le Bossu” (“You broke the rules of Aristotle, Horace, Vida, and Le Bossu”).

The lingering popularity of Vida's *Poetics* is demonstrated by the observation of a Prussian pastor, Johann David Müller, who complained in the preface to his translation of the *Christiad* (1811) that the *Poetics*, which shows the genius

of the author, is known quite well in every secondary school, unlike the *Christiad*.

Vimercato, Francesco

Born: 1512, Milan, Italy

Died: 1571, Milan, Italy

Leen Spruit

Faculty of Arts and Center for the History of Philosophy and Science, Radboud University Nijmegen, Nijmegen, The Netherlands

Abstract

Francesco Vimercato (1512–1571) studied philosophy in Bologna, Pavia, and Padua; he was Royal Reader in Greek, Latin, and philosophy in Paris; from 1561, he was a professor of philosophy at the newly founded University of Mondovì; he is known for his commentaries on Aristotle's psychological, ethical, and zoological works.

Biography

Francesco Vimercato was born in Milan in 1512, and he studied philosophy in Bologna, Pavia, and Padua. In 1540 he wrote an appeal for recognition to Pierre Du Châtelhad, a scholarly prelate, hoping to become one of the King's readers at the University of Paris. His letter was accompanied by a work entitled *De placitis naturalibus*

Platonis et Aristotelis (ms in Paris, Bibliothèque Nationale, Fond. Lat. 6330; Nardi 1958; Del Soldato 2012). In 1542 he was appointed king's reader in Greek and Latin philosophy. In 1543 he published a commentary on *De anima*, along with a "Peripatetic Discussion on the Rational Soul," in which he reviewed the discussions of Theophrastus, Alexander of Aphrodisias, Themistius, Simplicius, Scotus, Pomponazzi, and others on immortality (Vimercato 1543). Shortly after his appointment as king's reader, he became involved in the Ramist dispute, serving as one of the jurors in ten debates between Ramus and Goveanus. In 1550 he published his commentary on the *Physics* (Vimercato 1550), and in 1551 his analysis of Book Lambda of the *Metaphysics* (Vimercato 1551). In this work, dedicated to Cardinal de Bourbon, he defended the study of Greek philosophical theology (Vimercato 1543). His next work was a huge commentary on the *Meteorologica*, important for its philological qualities (Vimercato 1556). When Henry II was killed in 1559, he addressed the mourning Caterina de' Medici with a letter of consolation. In 1561 he found a new sponsor in Duke Emanuele Filiberto of Savoy, who called him to the chair of philosophy at the University of Mondovì (later, Turin). Vimercato was also named to the duke's governing council. In Turin he made the acquaintance of the mathematician Giovanni Battista Benedetti. From 1567 to 1570, he served as ambassador of the Duke of Savoy to Milan (Gilbert 1965; Schmitt 1983; Hasse 2004).

The work *De principiis rerum naturalium* was posthumously published (1596), and several commentaries on Aristotle remained unpublished (on *De caelo*, *Nicomachean Ethics*, *De partibus animalium*).

Vinet, Elias

► [Vinet, Élie](#)

Vinet, Élie

Born: 1509, Les Planches, Barbezieux - Saint-Hilaire, Saintonge area

Died: 1587, Bordeaux

Luigi-Alberto Sanchi

CNRS, Institut d'histoire du droit, Paris, France

Abstract

Professor at the Collège de Guyenne, Élie Vinet was a scholar with a manifold knowledge: he pioneered archaeological studies, wrote innovative books on antiquities in Bordeaux and its surroundings as well as on

sundials and on land surveying; prepared editions or translations of classical and medieval texts, especially Ausonius; and exchanged philological matters with the best scholars in his time, like de Thou, Cujas, and Scaliger. His international experience includes a period in Coimbra, Portugal, with André de Gouveia and other professors, invited by King John III.

Alternate Names

Vinet, Elias; Vinet, Helies; Vinetus Santonensis, Elias

Biography

Vinet's birth year, 1509, is obtained by deduction, since we know he died in 1587 at the age of 78. His birthplace, Les Planches, is in Barbezieux – Saint-Hilaire, in the ancient Saintonge area, which explains the form “Santonensis” in his name. As he recalls (Vinet 1568), his ancestors came from the Poitou region and turned the village's name into “Les Vinets.”

After studying at Poitiers University, Vinet had the opportunity to stay in Paris and learn Greek and mathematics at a high level. In 1539, he was appointed as a professor at the Collège de Guyenne, in Bordeaux, by its principal, the famous humanist André de Gouveia (Gaulleir 1874).

Vinet took soon a pause from teaching, 1542–1547, in order to prepare classical text editions for his students and colleagues (Desgraves 1977a); he thus published his first edition, Theognis, with a Latin translation (Vinet 1543). Then, André de Gouveia proposed him and other professors at Guyenne like George Buchanan and Diogo de Teive to found a College at Coimbra, Portugal, on the demand of King John III. This appointment lasted until Gouveia died, in June 1548, and Vinet returned to France the next year. During his stay in Portugal, Vinet visited Evora's site (Vinet 1565) and met the mathematician Pedro Nunes, from whom he learned the sundial's theory; later on, he wrote a treaty on this subject (Vinet 1564).

In 1556, the town council chose Vinet to become principal at his Collège de Guyenne, but

he had to wait until 1562 to obtain the appointment (Desgraves 1977a); in the meantime, he retired and wrote essays on his area's antiquities (Vinet 1565, 1567, 1568). He kept working on his philological editions and other historical research (see full bibliography in Desgraves 1977a); the discovery of a new Ausonius manuscript, acquired by Jacques Cujas, stimulated the critical work on the ancient Gallo-Roman poet. After a first edition (Vinet 1551), Vinet prepared a new one (Vinet 1580), which was published only after Joseph Scaliger set out his one, incomplete but with several “silent borrowings” from Vinet's scholarship (de La Ville de Mirmont 1917–1919; Desgraves 1977a; Grafton 1983), as it happened for other ancient authors that Vinet studied (Grafton 1993). On his death in 1587, the best French scholars honored his memory.

Vinet's manifold scholarship and industrious work set new standards for historical and archaeological research (Cooper 2005) and for the study of ancient and modern sciences and techniques, like land surveying (Vinet 1577). His editions and translations into Latin or French were often reprinted and obtained international success; his letters (Desgraves 1977b; Banderier 2004; Girot 2004) show the range of his philological discussions with scholars of the day, like Pierre Daniel, Cujas, or Henri de Mesmes. Vinet published the first French translation of Eginhard's *Life of Charlemagne* (Vinet 1546) and of Proclus' *Sphaera* (Vinet 1544).

Virgil in the Renaissance

Born: 70 BCE, near Mantua, Italy

Died: 19 BCE, Brindisi, Italy

L. B. T. Houghton

Department of Classics, University of Reading, Reading, UK

Abstract

The Roman poet Virgil played an important part in the thought and writings of Renaissance philosophers, largely as a result of the enduring place held by his poetry in Renaissance education and the long tradition of philosophical interpretations of Virgil's works.

A Continuing Tradition

The poetry of Virgil occupied a central position in educational curricula throughout the period of the Renaissance. Language and imagery from the works of the Roman poet consequently permeated almost every aspect of Renaissance culture, and philosophy was no exception (Zabughin 1921–1923; Baswell 1995; Wilson-Okamura 2010; Usher and Fernbach 2012; Hardie 2014; Houghton and Sgarbi 2018). From late antiquity, Virgil's poems had been regarded as a repository of philosophy and other wisdom (see especially the late antique commentary of Servius, Fulgentius' *Expositio Virgilianae continentiae*, and the disquisitions on Virgil's compendious learning in Macrobius' *Saturnalia*), and this tendency continued through the Middle Ages and into the early modern period. In his treatise on the study of literature, Leonardo Bruni quotes Virgil's lines on the inner spirit pervading all things from the speech of Anchises in the underworld in the sixth book of the *Aeneid*, before going on to ask, "When we read these things, what philosopher do we not hold cheap? Who has ever spoken of the nature of the soul with such clarity and knowledge?" (*De studiis et litteris* 22, quoting Cicero, *De senectute*).

Cristoforo Landino, who also wrote a commentary on the *Aeneid*, devoted the third and fourth books of his *Disputationes Camaldulenses* to a Platonizing exegesis of the poem, the allegorical thrust of which bears some similarities to the readings of Virgil's epic expounded in earlier centuries by (pseudo-) Bernardus Silvestris and others (Kallendorf 1989, 129–165).

A Guide and Model

The *Aeneid*, in particular, was often seen as providing not only a model of literary eloquence but also a guide to moral and virtuous behavior (Kallendorf 1989). Petrarch, who in one of his later letters (*Seniles* 4.5) advanced an elaborate moralizing interpretation of the narrative of the poem, asserted that in his presentation of the figure of Aeneas, Virgil had intended to offer his readers a portrait of the perfect man (*vir perfectus*). Likewise, Landino maintained in a lecture delivered in Florence in the 1460s that the poet's aim had been "to encourage us not only to good speaking but to upright living, that he might advise the human race as best he could."

Nor was the poet's sphere of authority limited to matters of individual morality; in the city-states of Renaissance Italy, Virgil was also enrolled among the champions of civic and constitutional values, his famous words on the mission of Rome to spare the conquered and war down the proud from *Aeneid* 6.853 appearing beneath the personification of Magnanimity in Taddeo di Bartolo's frescoes in the Palazzo Pubblico of Siena. Virgil himself is depicted as one of a series of famous men from antiquity, scripture, and mythology in a series of fifteenth-century frescoes in the Palazzo Comunale of the small Tuscan commune of Lucignano, displaying on the pages of his book the same passage from *Aeneid* 6, with the word *Romane* (Roman) altered, consciously or otherwise, to *ratione* (by reason) – a significant modification, in view of the importance of "ragione" (reason) in late medieval Italian civic discourse. Craig Kallendorf has demonstrated how Virgil's works were later used to reinforce the distinctive emphases of the "Myth of Venice," promoting

civic cohesion and suppressing possible sources of challenge and dissent (Kallendorf 1999).

Philosophy and Religion

Various attempts were made to accommodate Virgil's poetry within formal philosophical systems. The adoption of the classical author as a forerunner and figurehead by Landino (for whom Virgil was "altogether a Platonist") and other exponents of Neoplatonism has already been noted; the Ferrarese scholar Nascimbene Nascimbeni set out to produce a commentary on the first six books of the *Aeneid* "according to the thought of Aristotle and Plato" (Zabughin 1921–1923, 2:79–81). The Roman poet was also widely revered as a conduit of theological truths, mainly thanks to the long tradition of seeing his fourth eclogue, with its predictions of the return of the Virgin, the birth of a divine child who will restore the Golden Age, and peace and abundance in the natural world (expressed in terms reminiscent of the prophecies of Isaiah) as a conscious or unconscious anticipation of the birth of Christ (Ziolkowski and Putnam 2008, 487–503). Famously affirmed by Dante's Statius (*Purgatorio* 22.64–73), this conception finds expression in the works of Coluccio Salutati, Leonardo Bruni, and Antonio Mancinelli, among others.

Abstract

Francisco de Vitoria is recognized not only as one of the founding fathers of international law but also as one of the renovators of the sixteenth-century theological method. During his 20 years of teaching, he carried out an intense intellectual activity of reflection on various themes and problems not only of an academic nature but also related to the strong political, social, and economic tensions that marked the first half of the sixteenth century. Thomas Aquinas was his guide to the discussion of these problems. By adopting Aquinas' *Summa Theologiae* in place of Peter Lombard's *Sentences* for his classes, he renewed university teaching. As a matter of fact, it is from Aquinas' work that he drew the main theoretical fundaments of his own reflections on the pressing issues that mid-sixteenth-century European consciences were called to face for the first time. Specifically, he commented I-IIae qq. 90–108. There, he found the concept of *lex naturalis*, which became the main focus of his ethical and political speculation. The importance Vitoria gave to the natural law can be seen in the *De Indis* (1539), with which the author joined the debate on the thorny question of the legitimacy of the Spanish conquest of the American territories. Indeed, in this *relectio* he managed to combine a new interpretation of subjective rights with the theme of natural law, typical of the medieval tradition, this way proposing a valid defense in favor of the Indians.

Biography

Francisco de Vitoria, born in Burgos in 1483, is recognized not only as one of the founding fathers of international law but also as one of the renovators of the sixteenth-century theological method. His father, originally from Vitoria, holds an important position in Burgos at the service of the Catholic Kings. Therefore, since Vitoria comes from a well-off family, he has a privileged education (Hernández Martín 1995, 11–16).

In 1505, he enters the Dominican Order. At the end of the summer of 1508, he moves to Paris to complete his philosophy studies and begin his theology studies (Lamacchia 1995, 19–33). In these years, he resides at the convent of Saint Jacques, where he obtains a Master's Degree in Arts (1509) and a Doctorate in Theology (1522). There, he also begins his career as a teacher which he will continue upon his return to Spain in 1523 at the Colegio de San Gregorio of Valladolid. In 1526, he becomes a professor of *Prima Theologiae* at the University of Salamanca, a position that he will hold until his death in 1546 (Belda Plans 2000, 317–333).

During his 20 years of teaching, he carries out an intense intellectual activity of reflection on various themes and problems not only of an academic nature but also related to the strong political, social, and economic tensions that marked the first half of the sixteenth century. Thomas Aquinas is his guide to the discussion of these problems. By adopting Aquinas' *Summa Theologiae* in place of Peter Lombard's *Sentences*, he renews university teaching, this leading to a rebirth of far-reaching theological studies with consequences at a European level.

The work of Francisco de Vitoria can basically be divided into two main groups.

The first group includes the *Lecturae*, that is, his ordinary university lectures on the *Summa Theologiae* or Peter Lombard's *Sentences* (Lamacchia 1995, 36–39).

The choice of the *Summa* as the textbook for his courses from 1526 onward constitutes the fundamental characteristic of his teaching in Salamanca, during which he explains the *Summa* twice.

During his magisterium he holds a series of courses: 1526–1527, II book of the *Sentences*; 1527–1529, II-IIae of the *Summa theologiae*; 1529–1531, IV book of the *Sentences*; 1531–1533, I pars della *Summa theologiae*; 1533–34, I-IIa of the *Summa theologiae*; 1534–1537, II-IIae of the *Summa theologiae*; 1537–1538, III pars (qq. 1–59) of the *Summa theologiae*; 1538–1539, IV book of the *Sentences*; 1539–1541, I pars of the *Summa theologiae*; and 1541–1542, I-IIae of the *Summa theologiae* (Beltrán de Heredia 1928, 114). The contents of these ordinary lessons are described in the *Reportationes* of his students (Langella 2011, 30–34).

The second group, instead, includes the *Relectiones* (Lamacchia 1995, 40–45). These are the solemn lessons that professors have to hold on a yearly basis on a monographic theme in front of the entire University and whose function is to investigate in-depth a particularly difficult subject that, due to its complexity, cannot be explained in full during ordinary classes. These lessons can either be focused on a current topic or on a theme related to the academic course held by the professor. Dealing above all with topical issues, Vitoria has the ability to transform this academic obligation into an opportunity to discuss important issues such as morality and law, which will always make reference to the historical context of his time. The main issues he discusses include the so-called Indian question but also the limits of civil and spiritual power, Papal power, conciliarism, and war, as well as more specific issues such as suicide and marriage. The *Relectiones* of Vitoria that we can still read today include *De potestate civili*, *De homicidio*, *De matrimonio*, *De potestate Ecclesiae prior*, *De potestate Ecclesiae posterior*, *De potestate Papae et concilii*, *De augmento caritatis*, *De eo ad quod tenetur veniens ad usum rationis*, *De simonia*, *De temperantia*, *De indis prior*, *De iure belli o De indis posterior*, and *De magia*. Both his first lecture, *De silentii obligatione*, dating back to the academic year 1526–1527, and the lecture dating back to the academic year 1540–1541, continuing on the subject dealt with in the *De Magia*, have been lost. The 13 Reflections above are held by Vitoria between 1528 and 1540, with

the exception of the academic years 1531–1532 and 1536–1537, during which he does not hold any. In the academic years 1534–1535 and 1538–1539, instead, Vitoria holds four *relectiones* (Beltrán de Heredia 1928, 73 and 132–153).

Heritage and Rupture with the Tradition

In 1526, Vitoria replaces Peter Lombard's *Liber Sententiarum* with Thomas Aquinas' *Summa Theologiae* as his course book (Aquinas 1882, *Summa Theologiae*). From this text, he draws the main theoretical fundaments of his own reflections on the pressing issues that mid-sixteenth-century European consciences are called to face for the first time.

More precisely, by commenting on I-IIae, qq. 90–108, he finds in the concept of *lex naturalis* the main focus of his ethical and political speculation. In his commentary dating back to academic year 1533–1534, he defines the essence of the *lex* in itself – a definition that can be applied to any kind of law.

Vitoria states that the law is the rule and measure of human acts and that the word *ley* (law) comes from Latin *legare* (bond), as it poses an obligation. Therefore it belongs to reason, as it is the duty of the reason to issue commands. In other words, law in itself carries the obligation to act, as it is the rule and measure of human acts (Vitoria 2010, 88).

As for the *vexata quaestio* as to whether law is an act of intellect or will, Vitoria underlines, in contrast with the shared opinion of “modern” philosophers, that law is a mandate that belongs *immediate ad rationem* (Vitoria 2010, 90). In actual fact, law is determined by reason, not will, as it has a purpose; commanding, however, is an act that is typical of and exclusive to an intelligent being and, hence, is an act of intellect. Therefore, law is an order by reason, a rule, norm, or measure of acts, through which men are induced to act or are restrained from acting. It is an obligatory mandate and, as such, not only does it show the way but also gives an order that must be obeyed.

If law is a rule, a measure of the righteousness of human acts, the purpose of law must be good. Law must always be aimed at the common good (Vitoria 2010, 92). All norms that are not aimed at

the common good are not laws, as this is the characteristic that defines a law as right and good. The fact that it is aimed at the common good, however, does not imply that the private and individual good must be disregarded, even though, first and foremost, it is the common good that must be achieved, while the private good is secondary.

The ordination for the common good does not originate from the arbitrary will of the legislator: it is the law, by its own nature, that is ordained for the common good. This ordination constitutes the purpose of the law because, as the common good ceases, the law also ceases. Since the law is necessarily ordained for the common good, it may exclusively be promulgated by the ruler for the community he rules (Vitoria 2010, 94). Indeed, laws cannot be promulgated by anyone but only by those people who are in charge of the community. That is to say, only by those people who care for the same common good to which the law is directed: “non spectat facere leges ad rationem cuiuscumque, sed solum illius qui gerit curam communitatis, quia talis gerit curam boni communis ad quod ordinatur lex” (Vitoria 2010, 94).

Finally, for the law to be applied, its promulgation is necessary (Vitoria 2010, 96). The *promulgatio* is a necessary condition for a law to be enforceable and to establish obligations. Effectively, it is essential that the law be promulgated, as a rule must be applied to those things it regulates and measures (Vitoria 2010, 96). In actual fact, in general, whoever ignores the law exclusively because it was not promulgated is excused by this fault and by the relative punishment. Without a doubt, the natural law, although ignored, does not cease to oblige. For instance, should a man marry his sister because he does not know of this bond, the marriage would not be valid, although his guilt may be pardoned because of his ignorance: *lex naturalis*, indeed, is valid and effective also for those for whom it has not been promulgated. Therefore, it is not necessary to be promulgated for it to oblige.

Nevertheless, as regards the positive divine law, Vitoria states that this law was not effective before being promulgated. Once promulgated,

however, the law obliged all persons, despite not having been promulgated to all. In the same way as the evangelic law became obliging since the moment it was promulgated, yet forgiving those who were not aware of it, now every man is obliged by the law of Christ, yet those who never heard of it are forgiven, should they not comply with it. In turn, even positive human law does not oblige anyone if it is not promulgated and has no strength or validity. Vitoria demonstrates this by asserting that issuing a law is ordering, but ordering is promulgating. If the prince issued a law that was obliging from the very moment of its creation to, for instance, sell the primogeniture and somebody had sold it before, the contract would not be valid. On the contrary, the law would have been valid if it had been promulgated. The legislator is a public representative and cannot create a law without publicly promulgating it. For the human law to oblige, it is not sufficient that it is promulgated privately in a group or among wise men. It needs to be solemnly promulgated. The prince only has the authority to create the law due to him being a public representative. Vitoria demonstrates this with an argument of reason: as a matter of fact, human laws must be aimed at easing the salvation of souls. If a private promulgation were sufficient, this would represent a great obstacle for men, as the obligations set forth could be ignored due to the ignorance of many. In any case, although a solemn promulgation is necessary for the human law to oblige, it is not necessary that it is promulgated before the whole community.

Having defined the essence of the universal *lex* that may be applied to any kind of law, as every law contains it by analogy, Vitoria defines the different types of law according to Saint Thomas' categories. *Lex* is divided into divine and human law. The former is further divided into eternal, natural, and positive law and the latter into ecclesiastic or canon law and civil law (Vitoria 2010, 106–109). The eternal law is almost not specified: it is nothing else but a practical principle promulgated from eternity by God. Moreover, since God is the supreme legislator, all other laws derive from it. Through human reason, the eternal law reveals itself as natural and human law. It is the

source and origin of all right laws, as they receive their mandatory force and normative character from the eternal law. Vitoria also states that, in the same way as a revealed knowledge was necessary, because human science is full of errors and requires a great deal of time to reach the truth, a revealed divine law was also necessary, along with the *lex naturalis*, although the natural law also made it possible to save some men (Langella 2013, 164–165).

The eternal law, the *ratio* governing the universe, governs all rational and irrational beings with its wisdom. However, if everything is subject to the eternal law by its own inclination, as far as knowledge is concerned, only the rational creatures are subject to it (Vitoria 2010, 120). Therefore, men are subject to the law in two different ways: by nature and because they are rational beings. This latter aspect is the basis of the *lex naturalis*. Strictly speaking, it not only belongs to reason, but it is naturally inscribed in the minds and hearts of men (Rom 2:14). Hence, not only does it conform to reason, but it is also intrinsically related to the same needs of human nature: reason, by examining the natural inclination of men, prescribes what men must or must not do to be fulfilled.

The inclinations that allow the *ratio* to know the *lex naturalis* may be classified into three groups: those shared by men with all living creatures, those shared by men with animals, and those that are strictly human. Therefore, the natural law is the rational expression of the different inclinations of the human nature toward good. Hence, the precepts of the natural law are multiple, although they can be reduced to a single principle, on which all actions are based: “*Bonum est faciendum et prosequendum, et malum vitandum.*” This first principle is based on the notion of good, as the good is what all beings seek and is compelled by practical reason, without mediation (Vitoria 2010, 124). Following Saint Thomas' doctrine, Vitoria asserts that those things to which man is naturally inclined are naturally apprehended by reason as being good, and because of this, good is to be done, while their contraries are apprehended as evil and are to be avoided. Indeed, good is the object of pursuit, while evil is its contrary. Hence, the order of

precepts of the natural law follows the order of natural inclinations. In actual fact, the objective basis of these practical judgments is found by reason in the different rational tendencies of nature: by way of example, the natural inclination to live leads to the human rights to life and to its protection and development. From there, it is possible to deduce that not only do several principles exist, given that several natural inclinations exist, but also that acting against the natural inclinations means acting against the natural law itself (Vitoria 2010, 124).

It has already been stated that the *lex naturalis* is the result of the *naturalis ratio*. The pure natural reason, however, does not consist in expressing these clear judgments on what is right or wrong. Rather, it consists of the *habitus* of the first practical principles, what Saint Thomas calls *synderesis* (St. Thomas, *Summa Theologiae*, I, q. 79, a. 12). Now therefore, wondering if the natural law is a *habitus*, Saint Thomas clarifies that it cannot be a *habitus*, either properly or essentially. It can be called so in an improper manner only (St. Thomas, *Summa Theologiae*, Ia-IIae, q. 94, a. 1). In this regard, Vitoria adds that the natural law can be called a habit not because it really is a habit but rather because it is something which we hold by a habit. Indeed, by natural inclination we believe that these things are right (Vitoria 2010, 122). Hence, the natural law is not the reason considered as a faculty, nor the act of practical reason, but the product of the act or of the immediate and spontaneous activity of reason. In other words, it is the *opus rationis*.

Human reason only is clearly provided with the first principles that are known to it without effort. For this reason, also practical intellect has immediate access to the common principles, or general maxims, that are imposed by their own evidence. Starting from these principles, our reason must process, through a slow deductive process, all other precepts that belong to the natural law. Hence, different degrees exist between the natural precepts, depending on their proximity to the first practical principles, in the same way as this occurs in the speculative field, typical of sciences. These secondary precepts are derived from the first principles either as proximate and immediate conclusions that are deduced from them without any

effort, or as remote conclusions, that can be reached by reason only thanks to elaborate reasoning, that is within reach of the wise men only.

Moreover, as is the case for all other laws, the natural law also partakes in and is a reflection of the eternal law (Vitoria 2010, 106 and 118). Thanks to this participation in the eternal law, whose knowledge is by itself reserved for the blessed, men can come to know it by means of the principles of the natural law (Vitoria 2010, 130). In this regard, it must be stressed that despite the fact that all laws, in essence, participate in the eternal law, there is no doubt that the *lex naturalis* boasts a privileged relationship with it (Vitoria 2010, 130). Because of this, it has a nature of law to the highest degree (St. Thomas, *Summa Theologiae*, Ia-IIae, q. 91, a. 2).

Finally, as has already been stated, the natural law, although ignored, is in any case a real law and does not require to be promulgated in order to be obliging. Hence, it cannot be dispensed or revoked.

The natural law is a reflection of the primordial needs of human nature, and therefore, it is just like nature itself: one, universal, and immutable (Vitoria 2010, 98). All precepts contained therein are inscribed in a first, universal principle: "*Bonum est amandum et malum fugiendum.*" Moreover, as far as the first principles are concerned, the natural law is the same for everyone, both as regards its knowledge and as regards the validity and truth of its principles. With regard to these, indeed, it is known by all men and is always true and just. In the same way as the first speculative principles are known by everyone and are always valid, the same must be said for the first practical principles, due to their similarity with the speculative principles. However, as regards the conclusions that can be drawn from the first principles of the natural law, they are not always known by men, be it because of ignorance or owing to the many circumstances that must be taken into account to know what is right and what is not (Vitoria 2010, 126). This means that the further the conclusions are from the first principles, the more mistaken the intellect can be about them. Indeed, drawing universal conclusions from some principles, to be applied to

specific actions, requires taking into account several circumstances that may invalidate the correctness of the reasoning and is, therefore, the prerogative of the wise man. This leads to the acceptance of progress in the knowledge of the natural law, in terms of clarification, that does not demonstrate an alteration in the *lex naturalis* but rather, a development in the knowledge that humans have of it (Barrientos García 1978, 124).

Finally, as concerns the immutability of the natural law, it should be stated that it may change by “addition” only; this means that only circumstances may be added to it to improve it. On the contrary, it cannot be changed by “subtraction”; this means that no principle can ever be abolished. Indeed, the first principles can never be altered by subtraction, although the secondary principles can vary. An instance of this can be seen in the conclusions drawn from the first principles. In actual fact, however, also concerning the secondary principles, the change does not properly concern the law; rather, the change takes place because of the variability of the matter to which it applies.

The third property of the natural law implies that human or divine authorities cannot dispense with it. As for human authority, it is clear that it is in charge of the custody and safeguarding the natural and divine laws and, consequently, does not have the competence to modify them. On the contrary, the problem arises before the almightiness of God (Vitoria 2010, 194). Indeed, some events described in the Bible seem to suggest that there actually is some dispensation with certain actions ordered by God as regards the precepts of the Decalogue, such as the order that God gave to Abraham to sacrifice his son Isaac, the topic of fornication (Gn 22:2), what is stated in the Book of Oseas (Os 1), or even the Jews’ plundering of the Egyptians’ goods (Ex 12:35–36).

The problem was already discussed by Saint Thomas who, in his comment to q. 66, a. 5, of the *Ila-IIae*, wonders if the mandate God gave to the Jews to plunder the Egyptians of their goods was or was not to be intended as stealing. In this regard, Vitoria expressed the opinion of Ockham and of those authors who admitted the dispensation with all precepts of the Decalogue by divine

will; Vitoria was against Scotus’ opinion, who instead asserted that such a possibility was allowed exclusively as regards the precepts related to the fellow man, thus excluding the precepts contained in the first tablet from dispensation (Saint Augustine, *Sermo* 33, 2. PL 38, 208). Scotus then asserted that “dispensation” can be understood in three different ways. According to the first inappropriate interpretation, “dispensation” means completely revoking a law, repealing it. According to the second interpretation, it means “interpreting and clarifying” what the law implies or does not imply, depending on the circumstances, as is the case for a bishop who explains that someone is not obliged to fast for a given reason. Finally, “dispensation” is intended in its proper meaning to allow someone to act contrary to an obligation. Vitoria states that this is the way according to which the term must be interpreted to debate the problem.

The opinion supported by Ockham, according to which God not only can dispense with the precepts of the Decalogue but also order the contrary, appears to be irrational to Vitoria, as God’s almightiness may not imply contradictions. However, dispensing with the precepts of the Decalogue does imply contradictions, as one may hate God and do good, thus being a friend and an enemy of God, which is impossible. Therefore, no dispensation or repeal from the legislator of the natural right, that is God, is admitted by Vitoria (2010, 198) who, however, admits that Scotus’ intermediate theory may somehow be likely (Vitoria 2010, 206).

To solve the problem, Vitoria observes that God almighty has two different powers over the universe: one deriving from his role of creator, thanks to which he is the lord and owner of everything, and one deriving from his role as legislator and universal judge. By virtue of the latter power, God may not command that someone lawfully steals goods from someone else, as this is intrinsically bad. There is no doubt that he may command to do so, in his role of lord, but this does not imply any dispensation with the law, considering that he is donating something over which he has full command. By resorting to this dual power of God, it is possible to explain the passages in the

Scriptures where it may appear that there exists a dispensation with the precepts of the Decalogue such as, for instance, the order God gave to the Jews to take possession of the goods of the Egyptians or the order to sacrifice Isaac. In actual facts, since God acted by virtue of his right as creator, no dispensation was necessary at all.

The importance given by Vitoria to natural law can be seen in the *De Indis* (1539), with which Vitoria joins the debate on the thorny question of the legitimacy of the Spanish conquest of the American territories. In this *relectio*, he manages to unite the theme of the medieval tradition of natural law with a new interpretation of subjective rights, thus laying the foundations for a valid defense of the Indians.

Now, the complex conceptual structure of the *De Indis* can be schematically simplified by identifying a *pars destruens* and a *pars construens* which, respectively, analyze the illegitimate and legitimate titles for the *Conquista*.

In the first part, having rejected the Medieval interpretation of the Pontiff as a *monarcha temporalis* in toto orbe, Vitoria defines two concepts, both proceeding from the natural right, *dominium* and *ius gentium* (Beneyto and Corti Varela 2017, 57–60).

As regards the concept of *dominium* (Vitoria 1934, III, q. 62, 61–221), it should be reminded that for a theologian, humans were the bearers of a “capacity to use things” not by human law but by natural law (Vitoria 1934, 82). In other words, Vitoria would propose *dominium* as an inalienable natural right (Folgado 1960, 191–198; Beneyto and Román Vaca 2014, 55–72; Langella 2015, 151–174).

To the objection of the *opositores* that saw in the natives’ sins of anthropophagy or sodomy their inability to self-control and therefore their incapacity with regard to *dominium*, Vitoria replied that guilt, madness, or idiocy did not affect human dignity or human capacity to own: the natives’ infidelity, and their state of sin, did not question their humanity but only made it weaker. Hence, Vitoria asserted that there was no cause that could legitimize the expropriation of the lands of the American Indians: the natural law and the faculty to possess or own things for their own use

would apply to them, just as they applied to the rest of humanity (Vitoria 2017, 525–567).

As regards the other fundamental concept debated in the *relectio* of 1539, it should be highlighted that it is not perchance that, in the *De Indis*, Vitoria stated that the *ius gentium* was derived from the natural law, clarifying all ambiguities of an interpretation that would see it on the cusp of the positive right. Indeed, for Vitoria the *ius gentium* was of natural right or derived from it: “Vel est ius naturale vel derivatur ex iure naturali” (Vitoria 2017, 658). However, in his commentary to the Ila-IIae, q. 57, of 1535, Vitoria included the *ius gentium* in the positive right. After stating that “quia omne aliud ius a iure naturali, est positivum. Dicitur enim positivum quia est ex aliquo beneplacito” (Vitoria 1934, 7), he affirmed that “ius gentium potius debet reponi sub iure positivo quam sub iure naturali” (Vitoria 1934, 14). In doing so, Vitoria wanted to reject a conception of the natural right that was traditionally extended to irrational beings as well and, at the same time, to limit a conception of the *ius gentium* that included all precepts which, according to the Spanish theologian, belonged to the natural right (Vitoria 1934, 13–14). For Vitoria, the *ius naturale* was, on the one hand, closely linked to human reason and, on the other, to what was good in itself, regardless of anything else.

In discussing this, it should be emphasized that for Luciano Pereña, it was impossible to state that Vitoria’s position on the right of nations, defended during the lecture of 1535, changed in 1539 with the drafting of the *De Indis*. According to the scholar, Vitoria always supported the positive, constitutional, and historical character of the *ius gentium*. In the *Relectio* of 1539, Vitoria wanted to demonstrate and affirm the rights of the Spanish with regard to the foreign peoples (Pereña Vicente 1952, 620). As noted by Reginaldo Pizzoni, however, if the vision of the right of the nations was completely positive, the *relectio De Indis* and the *De iure belli* would have had no reason to exist. More specifically, the *De Indis* would have lost its character of claim against the injustice perpetrated overseas, and this would have led to leaving the Indians at the Spanish conquerors’ mercy,

abandoned to their greed (Ramírez 1955, 145; Pizzorni 1988, 575).

In the second part of the *De Indis*, after examining a series of titles that are generally acknowledged to be valid and that are rejected by Vitoria, the Dominican Master detailed the possible legitimate and valid titles justifying the Spanish presence in America. The first title proposed the topic of the Spanish rights to cross the recently discovered lands and to remain there without causing any harm to the Indians. The second title newly discussed the question of the legitimacy of spreading the Christian faith. The third, fourth, and fifth titles were related to the right of the converted Indians to be defended and required the *iustum belli* against those princes imposing idolatry. The sixth and seventh titles once again declared the rights of the natives that were fighting one another to resort, following a free election, to the help of the Spanish administration (Vitoria 2017, 659–697). The last title finally referred to the utility, for the recently discovered peoples, to accept the administration and government of the King and Queen of Spain, considering that they knew the science and the mechanical arts and had no advanced agriculture and craftsmanship. As for the validity of this latter title, however, Vitoria had serious doubts (Vitoria 2017, 696–699).

In examining the legitimate titles, the new position of Vitoria is of paramount importance, as it was based on a new vision: the natural society of all peoples (Urdániz 1960, 598–600). Both in the first part of the *De Indis*, where the Master lists and rejects the illegitimate titles for the *Conquista*, and in the second part of the *relectio*, where the legitimate titles are analyzed, it is the natural right, the source of all other human laws, to be the *fil rouge* of his reasoning. Rights are granted to both the Europeans and the Indians and along with them, also duties. The illegitimate titles for the conquest are against the natural right, as they deprive the Indians of their right to property, to self-government, and to freedom (Vitoria 2017, 574–575). The Spanish, therefore, may not deprive them of their lands, as all peoples are entitled to own goods and to appoint rulers. The question thus appears to be resolved by Vitoria, in

view of the natural right that originally provided the human-kind with *dominium*.

In the same way, should the Indians deprive the Spanish of their natural right to cross their lands (Vitoria 2017, 658–661) and to trade with them (Vitoria 2017, 662–665), a right derived from the original and universal availability of the common good and of the *cognatio* of men (*Digesta* I, 1, 3), established among them by their own nature, or hinder evangelization (Vitoria 2017, 676–683), persecute those who converted (Vitoria 2017, 684–687), or even harm the innocent (Vitoria 2017, 688–691), or, in brief, should they not live in compliance with the *ius gentium*, which is based on natural law (Vitoria 2017, 666–667), then they would be unfair and so should be punished.

These last considerations on the Spanish rights were often misunderstood and interpreted as a method for Vitoria to give a legal basis to colonization wars (Todorov 1982, 191). In actual fact, the aim of Vitoria's reflection was to specifically, and not only formally, acknowledge the equality of the Indians, placing all subjects involved on the very same level, where duties and rights converge. Vitoria indeed recognizes that the Indians are rational and free subjects. They are the bearers of rights, and, as such, they are participants in natural justice, where duties and rights are intertwined by necessity and in a complementary fashion. Then, for Vitoria, the natural law is the basis on which the threads of the universal justice can be woven, where conflicts and issues, regarding all topics, ranging from mere political topics to spiritual ones, are ordained according to a rational layout.

Vives, Juan Luis

Born: 1492/93, Valencia, Spain

Died: 1540, Bruges, Belgium

Lorenzo Casini

Department of Philosophy, Uppsala University, Uppsala, Sweden

Abstract

Juan Luis Vives (1492/3–1540) was a Spanish-born humanist who spent the greater part of his life in the Low Countries. He strongly opposed scholasticism and made his mark as one of the most influential advocates of humanistic learning in the early sixteenth century. His bent was philosophical rather than philological. His works deal with a wide range of subjects including education, psychology, politics, social reform, and religion. Vives was not a systematic writer, which makes it difficult to classify him as a philosopher. His thought is eclectic and pragmatic, as well as historical, in

its orientation. He took what he considered most valid from a variety of sources and combined these elements into a Christianized Aristotelianism.

Biography

Juan Luis Vives was born in Valencia, Spain in 1492, or more likely in 1493. His parents were Jewish merchants who had converted to Catholicism and who strove to live with the insecurities of their precarious situation. His father, Luis Vives Valeriola (1453–1524), had been prosecuted in 1477 for secretly practicing Judaism. A second trial took place in 1522 and ended 2 years later when he was burned at the stake. His mother, Blanquina March (1473–1508), became a Christian in 1491, 1 year before the decree expelling Jews from Spain. She died in 1508 of the plague. Twenty years after her death, she was charged with having visited a clandestine synagogue. Her remains were exhumed and publicly burned.

In his youth, Vives attended the Estudio General of his hometown. In 1509, he moved to Paris and enrolled as a freshman in the faculty of arts. He was never to return to Spain. Vives began his studies at the Collège de Lisieux, where Juan Dolz del Castellar had just started a triennial course, but soon moved to the Collège de Beauvais, where he attended the lectures of the Fleming Jan Dullaert (1470–1513). From the fall of 1512, Vives started to attend the course of the Aragonese Gaspar Lax (1487–1560) at the Collège de Montaigu. Through Nicolas Bérault (c.1470–c.1545), who was an associate of Guillaume Budé (1467–1540) and taught at various colleges in Paris, Vives also came into contact with the Parisian humanist circle.

In 1514, Vives left Paris without having taken any formal academic degree and moved to the Low Countries. He settled in Bruges, where he became the tutor to the children of Bernard Valldaura, a wealthy merchant of the flourishing Spanish community of that city. About this time, he was introduced to the court of Brussels, where he met Erasmus and, around 1517, was appointed as tutor to the Flemish nobleman William II of

Croy. Until Croy's sudden death in 1521, Vives lived in Louvain and taught at the Collegium Trilingue, a humanist foundation based on Erasmian educational principles. In this period, he wrote *Fabula de homine* (*A Fable about Man*, 1518), an early version of his views on the nature and purpose of mankind (Colish, 1962; De Bom, 2008); *De initiis, sectis et laudibus philosophiae* (*On the Origins, Schools and Merits of Philosophy*, 1518), a short essay on the history of philosophy; *In pseudodialecticis* (*Against the Pseudo-Dialecticians*, 1520), a lively and trenchant attack on scholastic logic; as well as a critical edition, with an extensive commentary, of Augustine's *De civitate Dei* (*City of God*, 1522), which was commissioned by Erasmus.

From 1523 to 1528, Vives divided his time between England, which he visited on six occasions, and Bruges, where he married Margarita Valldaura (1505–1552) in 1524. In England, he attended the court of Henry VIII and Catherine of Aragon and was tutor to their daughter, Mary. He also held a lectureship at Corpus Christi College, Oxford, and associated with English humanists such as Thomas More and Thomas Linacre. During these years, he published *De institutione feminae Christianae* (*The Education of a Christian Woman*, 1524), in which he set out pedagogical principles for the instruction of women; the extremely popular *Introductio ad sapientiam* (*Introduction to Wisdom*, 1524), a short handbook of ethics, blending Stoicism and Christianity; and *De subventionem pauperum* (*On Assistance to the Poor*, 1526), a program for the organization of public relief, which he dedicated to the magistrates of Bruges. In 1528, he lost the favor of Henry VIII by siding with his fellow countrywoman Catherine of Aragon in the matter of the divorce. He was placed under house arrest for a time, before being allowed to return to Bruges.

The last 12 years of Vives' life were his most productive, and it was in this period that he published several of the works for which he is best known today. These include *De concordia et discordia in humano genere* (*On Concord and Discord in Humankind*, 1529), a piece of social criticism emphasizing the value of peace and the absurdity of war; *De disciplinis* (*On the*

Disciplines, 1531), an encyclopedic treatise providing an extensive critique of the foundations of contemporary education, as well as a program for its renewal; and *De anima et vita* (*On the Soul and Life*, 1538), a study of the soul and its interaction with the body, which also contains a penetrating analysis of the emotions. *De veritate fidei Christianae* (*On the Truth of the Christian Faith*), the most thorough discussion of his religious views, was published posthumously in 1543. He died in Bruges in 1540.

Heritage and Rupture with the Tradition

Vives' career as a leading northern European humanist starts with the publication in 1520 of *In pseudodialecticis*, a satirical diatribe in which he voices his opposition to scholastic logic on several counts (Fantazzi, 2008). He follows in the footsteps of earlier humanists such as Lorenzo Valla (1406–57) and Rudolph Agricola (1443–85), who set about to replace the scholastic curriculum, based on syllogistic and disputation, with a treatment of logic oriented toward the use of the topics, a technique of verbal association aiming at the invention and organization of material for arguments, and persuasion. Vives' severe censure of scholastic logic was derived from his own unhappy experience with the scholastic curriculum at Paris. Therefore, as he himself emphasized, no one could accuse him of "condemning it because he did not understand it" (*Opera omnia*, 1964, III, 38; all references below are to this edition). Erasmus wrote to More that no one was better suited for the battle against the dialecticians, in whose ranks he had served for many years.

The main targets of Vives' criticism are Peter of Spain's *Summulae logicales*, a work dating from the thirteenth century but which still held an important place in the university curriculum, and the theory of the property of terms, a semantic theory dealing with properties of linguistic expressions such as signification, i.e., the meaning of a word regardless of context, and supposition, i.e., the meaning of a word within the context of its use in a proposition. He repudiates the use of technical jargon, accessible only to a narrow

group of professionals, and maintains that if scholastic logicians made an effort to speak plainly and according to common usage, many of their conundrums would disappear. Instead, they choose to fritter away their ingenuity on logically ambiguous propositions known as *sophismata*. Vives provides many examples of such propositions, which in his view make no sense whatever and are certainly of no use. Many of these, such as "Some animal is not man, therefore some man is not animal" (III, 54), were standard scholastic examples. Others, such as "Only any non-donkey *c* of any man except Socrates and another *c* belonging to this same man begins contingently to be black" (III, 40), are intended as a mockery of the futile quibbling he associated with scholastic method. Since dialectic, like rhetoric and grammar, deals with language, its rules should be adapted to the rules of ordinary language; but with what language, he asks, have these propositions to do? Moreover, dialectic should not be learned for its own sake, but as a support for the other arts; therefore, no more effort should be spent on it than is absolutely necessary. Vives' criticism is also informed by ethical concerns and the demand for a method that would be of use in everyday life rather than in academic disputations. According to him, those who spend too many years in these futile and inane studies, "when brought out from under their scholastic roofs into the gatherings of prudent men, look so dumbfounded that they would think they had been brought up in the woods. They seem so mystified by the strangeness and unfamiliarity of everything that you would think that they had been introduced into another world. So ignorant are they of life and common sense, so embarrassed, so tongue-tied, that if they were to do or say something, you would swear that they were not men at all. [...] The result is that in the conduct of business, fulfillment of duties, administration of public or private affairs, and in questions of personal feelings, they show as much ineptitude as a man of straw" (III, 60).

A more detailed criticism can be found in *De disciplinis* of 1531. This encyclopedic treatise is divided into three parts: *De causis corruptarum artium* (*On the Causes of the Corruption of the*

Arts), seven books devoted to a thoroughgoing critique of the foundations of contemporary education; *De tradendis disciplinis* (*On Handing Down the Disciplines*), five books in which Vives outlines his program for linguistic and educational reform; and five shorter treatises *De artibus* (*On the Arts*), dealing mainly with logic and metaphysics. These five treatises include *De prima philosophia* (*On First Philosophy*), a compendium of Aristotelian physics and metaphysics from a Christian point of view; *De censura veri* (*On the Assessment of Truth*), a discussion of the proposition and the forms of argumentation; *De explanatione cuiusque essentiae* (*On the Explanation of Each Essence*), which offers an account of the predicables and definition; *De instrumento probabilitatis* (*On the Instrument of Probability*), which contains a theory of knowledge, as well as a detailed account of dialectical invention; and *De disputatione* (*On Disputation*), in which he discusses nonformal proofs. In these treatises, Vives not only continues the trends in humanist dialectic initiated by Valla and Agricola but also displays a familiarity with philosophical technicalities that was unusual among humanists and that reveals the more traditionally Aristotelian aspects of his thought. His appraisal of the Aristotelian corpus is summarized in *Censura de Aristotelis operibus* (*Assessment of Aristotle's Works*, 1538). A posthumously published treatise entitled *Dialectices libri quatuor* (*Four Books of Dialectic*, 1550) appears to be a youthful work that Vives evidently did not consider suitable for publication.

Vives' criticism of scholastic logic hinges on a profound analysis of the arts of discourse. For him, the supremacy of the *sermo communis* (ordinary discourse) over the abstract language of metaphysics is indisputable. Philosophy ought not to invent the language and subject of its own specific investigation (VI, 140). In *De causis corruptarum artium*, he writes: "enraged against nature, about which they know nothing, the dialecticians have constructed another one for themselves – that is to say, the nature of formalities, individual natures (*ecceitates*), realities, relations, Platonic ideas and other monstrosities which cannot be understood even by those who have invented them" (VI, 190–1). Instead of the formal

language of the dialecticians, which he found completely unsuited to interpret reality, he proposes the less rigorous but more concrete universe of everyday communication, which answers all our practical needs and aims to provide a knowledge that is useful (Nauta, 2015).

Vives was pessimistic about the possibility of attaining knowledge as understood in Aristotelian terms, and his thought anticipates the moderate skepticism of early modern philosophers such as Francisco Sanches (1551–1623) and Pierre Gassendi (1592–1655). Vives belongs, like Francis Bacon (1561–1626), to the so-called maker's knowledge tradition, which regards knowledge as a kind of making or as a capacity to make. He often insists on the practical nature of knowledge; for instance, in *De causis corruptarum artium*, he maintains that peasants and artisans know nature far better than many philosophers (VI, 190). In *Satellitium animi* (*The Soul's Escort*, 1524), a collection of aphorisms dedicated to Princess Mary, he points out that "man knows as far as he can make" (IV, 63). A central tenet of the maker's knowledge tradition is that man cannot gain access to nature's intimate works, since these, as *opera divina* (divine works), are only known to God, their maker. In *De prima philosophia*, he describes nature as an automatic machine, like a clock, prepared and adapted by God. Moreover, God is always present in nature, holding together his construction with his continual assistance in the same way as the human soul maintains the harmony of the human body (M, III, 212).

According to Vives, things have two different layers: one external, consisting of the sensible accidents of the thing, and another, internal, and therefore hidden, which is the essence of the thing (III, 197). "The true and genuine essences of all things," he writes, "are not known by us in themselves. They hide concealed in the innermost part of each thing where our mind, enclosed by the bulk of the body and the darkness of life, cannot penetrate" (III, 406–7). Vives subscribes to the Aristotelian principle that all of our knowledge has its origin in perception. We cannot learn anything, he asserts, except through the senses (III, 193 and 378). But he also maintains that the human mind "must realize that, since it is locked

up in a dark prison and surrounded by obscurity, it is prevented from understanding many things and cannot clearly observe or know what it wants: neither the concealed essence of material things, nor the quality and character of immaterial things; nor can it, on account of the gloom of the body, use its acuity and swiftness" (III, 329). In other words, since the senses cannot grasp what is incorporeal or hidden, sense perception does not yield any knowledge of the essence of things but only of their accidents. Vives' view, however, is that sensory knowledge must nonetheless be transcended by means of reasoning. Yet, according to him, the best that human reason can accomplish in this process is to provide a judgment grounded in all the available evidence, thereby increasing the probability of the conclusion. In his view, our knowledge of the essence of a thing is only an approximate guess based on the sensible operations of the thing in question: "Like those who live in a small room, with only one little window to the outside, do not see except through that window, thus we see nothing except through our senses. Nevertheless, we peep into the outside and with our mind we infer the existence of something beyond our senses, but only as much as our senses permit us to do. Our mind rises upon the senses, but is based upon them. The senses point to the way, nor is there any other. The mind infers the existence of something, but it does not see it. Therefore, when we say that something is or is not, that it is this or the other way, we determine it from the judgment of our own soul, not from the things themselves, because they are not their own measure, but our mind is" (III, 193–4).

The most reliable guide for human inquiry, he argues, is mankind's natural propensity toward what is good and true. This light of our mind, as he also calls it, is always, directly or indirectly, inclined toward what is good and true and can be regarded as the beginning and origin of prudence and of all sciences and arts. This natural propensity can be perfected if it is subjected to teaching and exercise, just as the seeds of plants grow better if they are cultivated by the industrious hands of a farmer. He found philosophical grounds for this idea in Cicero's report (see, e.g., *De natura deorum* [*On the Nature of the Gods*],

I.43–5) of the Hellenistic theory of *anticipationes* (anticipations) and of *naturales informationes* (natural notions), which we have not learned from teachers or custom, but are instead derived and received from nature (III, 356–7). Nevertheless, human knowledge can be nothing other than a finite participation in creation. Because of the limitations that characterize man's fallen state, investigations into the realm of nature can only lead to conjectures and not to firm and indubitable knowledge, which we neither deserve nor need. In *De prima philosophia*, Vives writes: "human inquiry comes to conjectural conclusions, for we do not deserve certain knowledge (*scientia*), stained by sin as we are and hence burdened with the great weight of the body; nor do we need it, for we see that man is ordained lord and master of everything in the sublunary world" (III, 188). In his opinion, certainty is not a prerequisite for advances in science and philosophy, and as a criterion for scientific progress and for the rational conduct of life, he advocates a method consisting of sound judgment based on experience (Casini, 2009).

History, seen as the sum of all human experience, is therefore of great importance for all branches of learning. In *De tradendis disciplinis*, Vives maintains that "history appears to surpass all disciplines, since it either gives birth to or nourishes, develops and cultivates all arts" (VI, 291). In this sense, history is not primarily regarded as the memory of great deeds or the source of useful examples, but as a process of development. In principle, every new generation is better equipped than the preceding one, since it can derive advantage from all earlier experience: "It is therefore clear – he maintains – that if only we apply our minds sufficiently, we can formulate better opinions about matters of life and nature than could Aristotle, Plato, or any of the ancients" (VI, 6–7). According to Vives, the saying "we are like dwarfs on the shoulders of giants" is plainly false. We are not dwarfs, nor were they giants. Our stature is the same (VI, 39). The idea of progress plays an essential role in Vives' conception of intellectual history, and several of the cultural problems he deals with, such as the causes of the corruption of the arts, are approached from a historical perspective (Bejczy, 2003).

Vives' moral philosophy stems mainly from his Christian humanism and is aimed at the reform of both individuals and society. He often proclaims the superiority of Christian ethics over pagan wisdom (I, 23; VI, 209–10). In *De causis corruptarum artium*, he argues at length that Aristotle's ethics, on account of its worldly conception of happiness and virtue, is completely incompatible with Christianity: "we cannot serve both Christ and Aristotle, whose teaching are diametrically opposed to each other" (VI, 218). He has more sympathy for Platonism and Stoicism, which he believes are broadly in line with Christian morality. In *De initiis, sectis et laudibus philosophiae*, he even asserts: "I do not think, in fact, that there is any truer Christian than the Stoic sage" (III, 17).

In *Introductio ad sapientiam*, inspired by the teaching of the Stoics, he recommends self-knowledge as the first step toward virtue, which he regards as the culmination of human perfection. We should not, in his judgment, call anything our own except our soul, in which learning and virtue, or their opposites, are to be found. The body is "a bonds slave of the soul" (*mancipium animi*), while such things as riches, power, nobility, honor, dignity, and their contraries, are completely external to man (I, 2; VI, 401). Vice follows from a wrong judgment about the value of things: "Nothing – he writes – is more destructive in human life than a corrupt judgment which gives no object its proper value" (I, 1). To be wise, however, is not only to have true opinions about things but also to translate this knowledge into action by desiring honorable things and avoiding evil (I, 2). Wisdom, therefore, requires the subordination of the passions to the control of the intellect.

Vives holds that the best means to secure the reform of society is through the moral and practical training of the individual. Man, by his own nature, is a social being: "Experience proves every day that man was created by God for society, both in this and in the eternal life. For this reason God inspired in man an admirable disposition of benevolence and good will toward other men" (VI, 222–3). In the first book of *De subventionem pauperum*, which consists of a theoretical

discussion of the human condition, he stresses not only our need for and dependency on others but also our natural inclination to love and help one another. He regards the development of society as a distinctly human achievement, based on the ability to profit from experience and turn knowledge to useful ends. Social problems, such as poverty and war, are the result of emotional disorders.

During Vives' lifetime, Europe experienced dissension and war between princes and within the church, as well as the increased threat posed by Muslim expansion into Western Europe. He addressed the problems of political and religious disturbances in several works, which also dealt with the psychological origins of discord, the proper conduct of all the offices of the commonweal, and the theme of Christian harmony. His major political text on European war and peace is *De concordia et discordia in humano genere* (1529), where he sets out the case for the origins of discord in society and then aims to show how peace and concord can be fostered through knowledge of human nature, especially the emotions. According to him, the virtue of the people can only be maintained and promoted in peace. "In war, as in a sick body, no member exercises its office properly" (V, 180f.).

Vives deplored the Italian war between France and Spain (1521–6), which, he felt, completely ignored the rights of the suffering population, and accused Francis I and Charles V of irresponsibility and criminal ambition (VI, 480). In these circumstances, he often referred to the notion of natural law, which, as he explains in his preface to Cicero's *De legibus* (*On the Laws*), has the same validity everywhere because it was impressed on the heart of every human being before birth (V, 494).

Another area in which Vives enjoyed considerable success was psychology. His philosophical reflections on the human soul are mainly concentrated in *De anima et vita*, published in 1538, which provides the psychological underpinning for many of his educational ideas and can be characterized as a prolegomenon to moral philosophy. He attempts to reconcile the Aristotelian view of the soul as an organizing and animating principle with the Platonic conception of the soul

as an immaterial and immortal substance. He also pays close attention to physiology and, following the Galenic tradition, maintains that our mental capacities depend on the temperament of our body (Casini, 2010).

The structure of the treatise is indebted to the traditional approach of faculty psychology, in which the soul is said to be composed of a number of different faculties or powers, each directed toward a different object and responsible for a distinct operation. The first book covers the functions of the vegetative soul (nutrition, growth, and reproduction), the sensitive soul (the five external senses), and the cogitative soul (the internal senses, i.e., a variety of cognitive faculties, including imagination, fantasy, and the estimative power, which are located in the three ventricles of the brain and whose acts follow from the acts of the external senses). The second book deals with the functions of the rational soul and its three faculties (mind, will, and memory), as well as with topics stemming from Aristotle's *Parva naturalia*, such as sleep, dreams, and longevity. The third and final book explores the emotions, which Vives, rejecting the Stoic view, regards as natural responses to the way things appear to us and as essential constituents of human life (Noreña, 1989; Casini, 2005).

He defines the soul as "the principal agent inhabiting a body adapted to life (*agens praecipuum, habitans in corpore apto ad vitam*).” The soul is called an agent in the sense that it acts through instruments – e.g., heat, humors, and spirits – by means of its own power. That it is the principal agent means that, even though its instruments act on the body, they do not operate by means of their own power but only through the power that they receive from the soul (III, 335–6). The organs governing our rational functions consist of fine and bright spirits exhaled from the pericardial blood. Although the heart is the source and origin of all the rational soul's operations, the head is their workshop. In fact, the mind does not apprehend, nor is it affected, unless the spirits reach the brain (III, 365–6).

According to Vives, the rational soul reflects the image of the trinity and includes three main functions, faculties, or powers: mind or

understanding, will, and memory. He maintains that the human being was created for the eternal good and was therefore endowed with the faculty to seek the good so that it might desire to turn to it and unite with it. This faculty is the will (Casini, 2006). That which is not understood, however, cannot be desired. Therefore we have also the faculty of understanding. According to Vives, there are two different acts of the will: approval (*approbatio*) and disapproval (*reprobatio*), from which our external actions follow. Approval, which pertains to the good, produces the effort to obtain it, and disapproval, which pertains to evil, produces either the reaction to overcome it or the retreat and the flight in order to avoid it (III, 386–7). According to Vives, the will is the ruler and commander of all things, but since it has no light of its own, it is illuminated by the mind, which has been paired with it, not in order to rule and force it, but to advise and guide it. The will does not try to pursue or avoid anything that has not been pointed out beforehand by reason. Thus, according to Vives, an act of will can be described as “conceived by reason, but delivered by the will” (III, 382). Moreover, when we reason, we pass from thought to thought, and therefore a kind of container for the storage of all our thoughts is necessary, so that we might return to these thoughts and fetch them when needed. This function is called memory (III, 341).

The enormous importance Vives attaches to the exploration of the emotions is reflected in the fact that he describes the branch of philosophy that provides a remedy for the severe diseases of the soul not only as “the foundation of all morality, private as well as public” (III, 299–300) but also as “the supreme form of learning and knowledge” (I, 17). Emotions (*affectus sive affectiones*) are defined as “the acts of those faculties which nature gave to our souls for the pursuit of good and the avoidance of evil, by means of which we are led toward the good and we move away from or against evil.” He stresses that the terms “good” and “evil” in this definition mean not what is in reality good or evil, but rather what each person judges to be good or evil (III, 422). Therefore, the more pure and elevated the judgment the more it takes account of what is genuinely good and true,

admitting fewer and less intense emotions and becoming disturbed more rarely. Immoderate and confused movements, on the other hand, are the result of ignorance, thoughtlessness, and false judgments, since we judge the good or evil to be greater than it really is (III, 425).

Vives distinguishes between different kinds of emotions in accordance with their intensity. He compares the motions of the emotional faculty with those of the sea:

Just as in the motions of the sea one is a soft breeze, one stronger, and another vehement, stirring up in a terrible storm the whole sea from the depths, along with the sand and the fishes; so in the motions of the soul, some are light, so that you might almost call them beginnings of a rising motion, some more intense, and others shake up the whole soul and drive it away from the seat of reason and condition of judgement. These are real disturbances and unrestrained motions, since now the soul is hardly in control of itself, becoming instead subject to an alien power, blinded and unable to see anything. The former you might rightly call emotions, while the latter are the commotions and agitations that the Greeks call *pathê*, that is, passions, since the whole soul suffers, as if from a blow, and becomes agitated (III, 424).

Vives' distinction between different degrees of emotion is also discernible in his classification of emotions, which is expounded in accordance with his definition, and distinguishes between movements toward the good and movements away from, or against evil:

All the motions of the soul are about the good or the evil, as far as it is the opposite of the good. These motions are toward the good, away from evil or against evil. Good and evil can be present, future, past or possible. The absence of good is evil and the absence of evil is good. The good, as soon as it becomes known to the mind, pleases us at once. This feeling is first like the gentle breeze of a rising motion, which is called liking (*allubescencia*). If it is confirmed, it becomes love (*amor*). The motion pertaining to a present good that we have attained is joy (*laetitia*), the motion pertaining to a future good is desire (*cupiditas*), and falls within the boundaries of love. The first motion pertaining to evil is called vexation (*offensio*), which is the opposite of pleasure. If it is confirmed, it becomes hatred (*odium*). The motion pertaining to a present evil is grief (*mæror*), the motion pertaining to a future evil is fear (*metus*). The motions against a present evil are anger (*ira*), envy (*invidia*) and indignation (*indignatio*). The motions against a future evil are

confidence (*fiducia*) and audacity (*audacia*). Under the heading of love, we find favour (*favor*), reverence (*reverentia*) and compassion (*misericordia*); under joy, pleasure (*delectatio*); under desire, hope (*spes*); under grief, longing (*desiderium*). Pride (*superbia*) is a monster composed of many emotions: joy, desire and confidence (III, 426).

One of the most distinctive features of Vives' study of the human soul is the fundamental role that psychological inquiry came to play in his reform program. His use of psychological principles in his writings often surpasses that of previous authors in both scope and detail. He applies these principles, for instance, not only to individual conduct and education but also to professional practice, social reform, and practical affairs in general. According to Vives, psychology is relevant to all disciplines. "The study of man's soul," he writes in *De tradendis disciplinis*, "exercises a most helpful influence on all kinds of knowledge, because our knowledge is determined by the intelligence and comprehension of our minds, not by the things themselves" (VI, 375).

In *De disciplinis*, Vives did not include a section on theology, which he proposed to deal with at a later time. His work *De veritate fidei Christianae* was still in progress when he died. The treatise, which consists of five books, was published posthumously in 1543. In the first two books, he exposes his views on God, human nature, and Christ. The next two books are dialogues, in which a Christian engages a Jewish and a Muslim interlocutor. The fifth book concludes by recapitulating the superiority of Christianity over any other persuasion (Colish, 2009).

Impact and Legacy

Vives' works, which went through hundreds of editions and were translated into several vernacular languages, continued to be widely read and extremely influential during the century after their publication. His critical attitude toward the Aristotelian orthodoxy of his day left a mark on several authors. Mario Nizolio (1488–1567) cites Vives numerous times in *De veris principiis et vera ratione philosophandi contra pseudo-philosophos* (*On the True Principles and True*

Method of Philosophizing against the Pseudo-Philosophers, 1553), an attack on Aristotelian dialectic and metaphysics, which G. W. Leibniz (1646–1716) considered being worth editing more than a hundred years later. In *Quod nihil scitur* (*That Nothing is Known*, 1581), one of the best systematic expositions of philosophical skepticism produced during the sixteenth century, the Portuguese philosopher and medical writer Francisco Sanches displays a familiarity with *De disciplinis*, and there are indications that he might also have been acquainted with *In pseudodialecticis*. In *Exercitationes paradoxicae adversus Aristoteleos* (*Paradoxical Exercises against the Aristotelians*, 1624), a skeptical attack on Aristotelianism, Pierre Gassendi says that reading Vives gave him courage and helped him to free himself from the dogmatism of Peripatetic philosophy.

Philip Melancthon (1497–1560) recommended *De anima et vita* in the prefatory letter to his *Commentarius de anima* (*Commentary on the Soul*, 1540). The Florentine humanist Benedetto Varchi (1503–1565) relied heavily on *De anima et vita*, especially in his treatment of jealousy. Vives' influence on the naturalistic pedagogy of the Spaniard Juan Huarte de San Juan (c.1529–1588), in his celebrated *El examen de ingenios para las ciencias* (*The Examination of Men's Wits*, 1575), is undeniable. In his discussion of the passions of the soul, the Jesuit Francisco Suárez (1548–1617) counted Vives among his authorities, pointing out that the study of emotions belongs to natural philosophy and medicine as well as to moral philosophy. Vives' treatise was also an important source of inspiration for Robert Burton (1577–1640), who, in *The Anatomy of Melancholy* (1621), repeatedly quotes from *De anima et vita*. The reference to Vives by René Descartes (1596–1650) in *Les Passions de l'âme* (1649) suggests that he had read the book.

Although Vives is rarely mentioned in the scholarly literature on the Scottish philosophy of "Common Sense," the impact of his thought on leading exponents of the school was significant. William Hamilton (1788–1856) praised Vives' insights on memory and the laws of association. In his "Contributions Towards a History of the Doctrine of Mental Suggestion or Association,"

he quotes extensive portions of Vives' account of memory and maintains that the observations of "the Spanish Aristotelian" comprise "nearly all of principal moment that has been said upon this subject, either before or since." Moreover, Vives' *Dialectices libri quatuor* (1550) was one of the primary sources of Thomas Reid (1710–1796) in his "A Brief Account of Aristotle's Logic" (1774).

During the second half of the nineteenth century and the first decades of the twentieth, Vives was mainly read and studied as a pedagogue and psychologist. In his most important philosophical work, the impressive *Geschichte des Materialismus*, which was printed in 1866 and remained a standard introduction to the history of philosophy well into the twentieth century, the German philosopher Friedrich Albert Lange (1828–1875), one of the originators of neo-Kantianism and a significant figure in the founding of the Marburg school, describes Vives as the most important reformer of philosophy of his time and a precursor of Francis Bacon and René Descartes. In a long article on Vives, published in the *Encyklopädie des gesamten Erziehungs- und Unterrichtswesens* in 1873, Lange calls Vives "the father of the new empirical psychology." This positive assessment concerning Vives' originality within the field of psychology has thereafter often been restated by scholars of many different nationalities.

Other major theorists that showed interest in Vives' ideas are Ernest Renan (1823–1892), Wilhelm Dilthey (1833–1911), Pierre Duhem (1861–1916), Ernst Cassirer (1874–1945), and José Ortega y Gasset (1883–1955). According to Ortega y Gasset, Vives' method, firmly based on experience, and his emphasis on the need to found a new culture grounded, not in barren speculation, but in the usefulness of knowledge, anticipate some important elements of the modern *Zeitgeist*.

Vlachos, Gerasimos

Born: ci. 1607, Candia (actual Crete)

Died: 1685, Corfu

Dimitrios Paradoulakis
Hamburg, Germany

Abstract

Cretan Greek Orthodox clergyman and intellectual with profound philological, theological, and philosophical training, who developed broad ecclesiastical and educational activity.

Biography

Born probably in 1607 in Venetian-ruled Candia, Gerasimos Vlachos derived from a noble and wealthy family (Spyridakis 1949, 70–84; Tatakis 1973, 3–27) About the first 35 years of his life, his studies, and his youth, there is no detailed information. He certainly acquired his basic education in his homeland, and there are hypotheses for possible further studies at the Università degli Artisti of Padua. By 1640 he had already been ordained a Greek Orthodox priest-monk (hieromonach) and had earned a reputation as a preacher and professor of sciences (philosophy and theology) in his hometown. With the onset of the fifth Ottoman-Venetian War of Candia (1645–1669), he developed patriotic activity on the side of the Venetians. He provided the latter with financial aid, and he warmly urged his compatriots to resist the invaders and participated in the armed defense of the besieged city (Olar 2016, 249–274). In his effort to maintain the unity and cooperation between the Greeks and the Venetians, he participated in a theological conflict instigated by the Jesuit missionaries of Santorini in 1653. In this context, he composed a pro-Orthodox brief treatise [*consulta*] entitled *Obfuscation of the False Believers* (Σκοτοδίνη τῶν μὴ ὀρθῶς φρονούντων) on the controversial subject of the essence of the Tabor light during the transfiguration of Christ. In late 1654 Vlachos was forced to abandon his homeland and seek refuge in Venice within the local Greek community. In 1656 he was appointed

teacher at the Greek School of the city, a post he occupied until 1662. One year after his appointment, he composed on behalf of the community and at the request of the Venetian Senate an encomiastic entreaty entitled *Triumph Against the Reign of the Turks* (Θρίαμβος κατά τῆς τῶν Τούρκων βασιλείας), addressed to the Tsar Aleksey Mikhailovich (1629–1676). In his text, Vlachos urged the Tsar to form an alliance with the Republic of Venice in order to repel the Ottoman peril in Eastern Mediterranean (Lascarides 2002, 251–279, 303–324). The Cretan scholar also offered valuable services to the French patrologist François Combefis (1605–1679), to whom he sent in 1658 a manuscript copy of the *omnia opera* of Saint Maximus the Confessor in order to be published in Paris. As a teacher at the Greek School, Vlachos published two works in order to be used as textbooks in the Greek educational institutions of Venice and Padua. First published was his four-lingual (ancient Greek, Latin, Italian, and vernacular Greek) dictionary entitled *Thesaurus encyclopaedicae basis quadrilinguis* (Θησαυρός τῆς ἐγκυκλοπαιδικῆς βάσεως τετραγλωσσος) [Venice: Ex Typographia Ducali Pinelliana, 1659]; 2 years later he published a bilingual collection of philosophical, theological, and philological definitions entitled *Harmonia Definitiva Entium de Mente Graecorū Doctorum* (Ἀρμονία ὀριστική τῶν ὄντων κατά τοὺς ἐλλήνων σοφούς) [Venice: Typis Andree Giuliani, 1661]. Failing to be reelected as a teacher in the Greek School in 1662, he became an abbot in the Greek Orthodox monastery of Virgin Mary of Palaiopolis in Corfu, where he settled in 1664 for almost 17 years. Alongside his priestly duties, he developed intense preaching activity and devoted himself to the composition of mainly theological treatises. These were a textbook on homiletics entitled *Teaching About the Pure Way to Teach the Divine and Holy Gospel* (Διδασκαλία περὶ τοῦ ἀκραιφνοῦς τρόπου τοῦ διδάσκειν τὸ θεῖον καὶ ἱερὸν Εὐαγγέλιον) and two polemical treatises: the first one *Against the Jews* (Κατὰ Ἰουδαίων) and the second one against the Muslims entitled *On Muhammad's Religion and Against the Turks* (Περὶ τῆς τοῦ Μωάμεθ θρησκείας καὶ κατὰ Τούρκων) (Argyriou 2017). On September 3, 1679, the Greek Confraternity of Venice elected Vlachos in the office of the Bishop of Philadelphia,

with the latter undertaking his church duties in early 1681. As the religious shepherd of the Greek community, he continued to preach to his flock the church doctrines and Christian teachings in San Giorgio dei Greci and proceeded to numerous measures for the relief of the refugees from the fallen Kingdom of Candia. Being characterized by the modern scholarship as the most intellectual of the bishops of Philadelphia, he exercised his hieratic duties until his death from apoplexy on March 24, 1685.

Impact and Legacy

Gerasimos Vlachos' writings can be classified into three principal categories: (a) grammatological (handbooks of ancient Greek and Latin grammar, rhetoric, metrics, epistolography, and dictionaries); (b) theological (homiletics, scholastic theology, didactic sermons, and polemical treatises); and (c) philosophical (introductions, summaries, anthologies, and commentaries on the Aristotelian corpus, specifically in the fields of Logic, Physics, and Metaphysics) (Camariano-Cioran 1974, 16–28; Bobou-Stamati 1975, 375–393; Apostolopoulos 1981, 187–195; Benakis 1986, 141–167; Fonkič 1994, 591–597). All of his works fulfill the same requirement, as they are chiefly intended as *vade mecum*s for teaching purposes and school use. His writings were widely circulated within Greek circles of both the Venetian Stato da Mar and the Ottoman Empire. The driving force of Vlachos' philosophical and pedagogical projects is considered the Aristotelian spirit and teaching. As a genuine seventeenth-century Greek scholar, he acted within the late Paduan perception of Aristotle, introduced, and established in the Greek region by the Athenian philosopher Theophilus Corydaleus (1570–1645). Undoubtedly, Vlachos had studied Corydaleus' philosophical method and the content of his commentaries. As a result, his interpretation agreed in its main and external points with the typical Corydalean method. The Cretan thinker first quoted in detail the various, often contradicting opinions of the most eminent authorities of the Aristotelian tradition. Then he critically reconsidered the issues he examined and refuted the opinions opposing his

argumentation. He often concluded to express an authentic philosophical word by offering his own personal opinion on each subject. However, the Cretan cleric placed limits on his philosophical thought by refusing to utterly reject the authority of the medieval scholastic commentators of Aristotle. In his writings, he seemed unwilling to abandon his religious culture, his ecclesiastical education, and his piety. In contradiction to Corydaleus' drastic separation of philosophical reasoning from theological thought, Vlachos' opinion is that the perception and interpretation of Aristotelian philosophy do not occur through its complete detachment from the Greek – as well as the Latin – theological tradition but through a fruitful conciliation of the two. Refusing at the same time to follow the standard practice of medieval scholasticism and manipulate philosophy as something inferior to theology, he promoted both as equal agents of spirituality, inseparably united and interdependent, but at the same time each one preserving its entity unalterably.

Abstract

Gerardus Joannes Vossius (1577–1649), a professor at Leiden University and the *Athenaeum illustre* in Amsterdam, was a philosopher in a

limited sense only: he was a polymath who wrote about history, poetry, culture, theology, and philosophy in a very systematic, encyclopedic, and eclectic way. As such, he was not so much an original thinker as an author who made topics easily accessible for fellow scholars, students, and well-educated patri-cians and merchants. Vossius made an important contribution to philosophy, by publishing his *De theologia gentili sive Physiologia christiana* (1642), a much-acclaimed introduction to the natural knowledge of God.

Biography

In the early spring of 1577, Gerardus Joannes Vossius was born in Heidelberg as the son of a merchant-preacher. In 1583, the family settled in Dordrecht, where both his parents died. Vossius stayed in Dordrecht and attended the Latin school. At the age of 18, he was granted a scholarship that enabled him to study *artes* and theology at Leiden University (he matriculated on 21 September 1595 and obtained his MA on 13 March 1598). First, he served as a teacher and rector at his former school in Dordrecht, but in 1615, he was nominated regent of the Leiden “States College,” the academic institute where future ministers of the Dutch Reformed Church received their theological training. In 1619, the quarrels on predestination and grace that shook the foundations of the Dutch Republic came to an end. Vossius was dismissed on the grounds that he was a “modern” theologian who advocated the “Arminian,” i.e., Remonstrant theology. The scholar’s stance in this opaque controversy is not easy to fathom. Although he pictured himself in a letter to Franciscus Gomarus as a rather unflagging orthodox believer who managed to keep his distance from innovative Arminian theology, he actually endorsed a view on grace and free will that, to say the least, positioned him as an outsider in the Contra-Remonstrant camp. Just like his friend Hugo Grotius, Vossius refused to wholeheartedly endorse harsh Contra-Remonstrant views, which he saw as a one-sided interpretation of the authoritative Church Father Augustine, who in his anti-

Pelagian polemics had bequeathed a legacy to the Church which had caused much internal strife throughout the centuries. Nonetheless, in 1622, Vossius overcame all difficulties by gaining a professorship in eloquence at Leiden University. His task was to teach Latin language and literature, and world history. In 1631, he moved to the newly created *Athenaeum Illustre* in Amsterdam, after attempts to offer him a professorship in Cambridge had come to nothing. As the first rector of the *Athenaeum*, he taught history and political science. With his colleague Caspar Barlaeus (1584–1648), who took care of the courses in philosophy and rhetoric, he maintained a lifelong friendship. It was during the Amsterdam period that he wrote and published most of his works, which cover a broad spectrum of disparate disciplines: history, rhetoric, linguistics, and literary, cultural, religious, and philosophical subjects. In the international world of scholarship, he distinguished himself as a prolific letter writer. His vast correspondence encompasses 3,388 letters, 1,296 of them written by Vossius himself and 2,092 addressed to him. He married twice, in 1602 with Elisabeth van den Corput, daughter of a minister, and after her death with Elisabeth du Jon, daughter of Franciscus Junius (Sr.). Of his ten children, only Isaac Vossius (1618–1689) would survive him. His brother-in-law was the philologist, theologian, and writer of art Franciscus Junius Jr. (1591–1677); they worked together on books of art theory. On 17 March 1649, Vossius died of an erysipelas infection that had forced him to stay in bed for 5 days. Quite symbolically, another story claims that the scholar met his fate when he climbed an unstable ladder, reached a book on the upper shelves of his library, and had some hefty folio volumes come down on him.

Introduction

At first sight, it seems strange to rank Vossius among the philosophers of the seventeenth century, for he hardly wrote on philosophy or philosophical topics in the modern sense of the word, and his few works on the subject were certainly

not original. However, as an author of systematically ordered surveys and reference works, he elaborated on many subjects regarding poetry, culture, theology, and philosophy. He often wrote about the “character” and “arrangement” of the subjects he treated, terms that are used in the title of some of his works, for example, *De artis poeticae natura ac constitutione* (1647). As such, he was not so much an original thinker, let alone an innovator, but rather an industrious polymath, who systematically applied traditional distinctions, divisions, and arrangements to the subjects he discussed, in an attempt to create a didactically sound program of learning. He unfolded a topic by dividing it into subtopics, dealt with its history, listed its main representatives, and went into many aspects related to it. Thus he tried to make the topics accessible to scholars, teachers, and students in an “encyclopedic” way. “Encyclopedic” has to be understood in two senses here: knowledge was analyzed and presented in an array of items as a (modern) encyclopedia does, treating all relevant details related to a particular subject, and it was synthesized as a part of the “entire circle of learning and education” as in the original meaning of the Greek “ἐγκύκλιος παιδεία.” Thus Vossius’s books, which together form the ideal curriculum of universal humanist learning, amply contributed to the erudition and conversational skills of the Dutch patricians, notably the elite of officeholders and merchants in a metropolis like Amsterdam, where Vossius concluded his impressive career. Not long after that, at the end of the seventeenth century, the wish to encompass all human knowledge in a more or less coherent frame lost its appeal. Trying to assess Vossius’s work as a historiographer, Wickenden reached the verdict that he was “not a fount of inspiration, but a quarry of materials.”

Beyond any doubt, Vossius made an important, albeit indirect, contribution to philosophy, by publishing his *De theologia gentili sive Physiologia christiana* (1642). In this work, he not only traced the origins of pagan mythology and cults, including those of the Far East and the newly discovered Americas, but he also delivered a detailed description of the natural world, God’s creation, and thus composed an introduction to the natural

knowledge of God. In the mythographical part, Vossius tied pagan deities to Biblical figures and historical heroes and explained supernatural phenomena in a rational way. His approach was purely literary: as in other works, he relied on previous authoritative works.

Vossius wrote three books on philosophy proper: the theses he defended for his academic promotion in 1598 (*Universalis philosophiae ἀκρωτηριάσμος*), briefly treating grammar, rhetoric, poetics, logic, metaphysics, physics, astronomy, and ethics, the posthumously published *De philosophia et philosophorum sectis* (1657), which discusses the philosophic currents and schools in antiquity, giving their main characteristics, and *De logica* (1658).

In *De artium et scientiarum natura ac constitutione libri quinque* (first published in 1697 in the *Opera omnia*), Vossius draws up an overview of humanistic knowledge. In this work, he takes logic not as a part of philosophy, but as an essential instrument for a philosopher. He defines philosophy in the medieval tradition as “knowledge of all things through causes, as far as a man can understand them by the light of nature” (cf. the scholastic definition: “philosophy is the science of all things through the highest causes, obtained by natural reason”). The work contains a summary of Aristotle’s works about logic. Vossius’s practical attitude is demonstrated by his division of philosophy into “*philosophia naturalis*” (including “*prima philosophia*” and metaphysics), leading to “*sapientia*,” and “*philosophia activa*” (including ethics, politics, and eloquence) that should lead to “*prudentia*.”

Heritage, Innovative Aspects, and Legacy

That Vossius does not rank as an innovative philosopher also comes to the fore in many of his works on other subjects where he upheld the preponderance of Aristotelian thought in the academic curriculum. In this respect, however, he was not very rigorous. His main goal was to collect all human knowledge and divide it into clear-cut pieces. In his opinion, knowledge should

be assembled and conveyed in a coherent and clear way, by means of ramification and eclectic procedures, in accordance with his concept of philosophy as knowledge by understanding the causes of phenomena. As an omnivorous reader, Vossius also stressed the paramount importance of a critical approach to written sources. In his view of history, he was certainly original, stressing the use of historiography as an independent discipline that should also serve as the basis of other disciplines of knowledge and science. The historian should first of all aim at a thorough knowledge of those facts that were useful for a comfortable and happy life. Furthermore, historical knowledge helped to understand the true character of the outside world and was – as a consequence – an auxiliary tool for philosophical understanding. But historical facts must be collected not only for their practical relevance or the insight they provide into natural phenomena but also for their use in ethics: history served as an arsenal for ethical rules. Historical research, therefore, should be accompanied with philosophical reflection.

Vossius applied the same approach to poetics: a literary genre can only be understood by delving into its origin and by dissecting it into several parts and aspects. In this way, Vossius distinguished himself as a predecessor of German positivism that equally claimed that insight in a phenomenon's causes implied understanding it. For Vossius, the ethical aspect was highly important in all spheres of knowledge, including those of poetics, music, and painting. Works of literature and of art should inspire high moral standards, instead of corroding them. He developed his views on this particular topic in his rhetorical works, where he expressly stated that the virtuous impression one makes on one's audience is of paramount importance. Understandably enough, most of his work has to do with ethics as the preeminent branch of philosophy. Furthermore, it is important to note that in all of his works, Vossius comes to the fore as an eclecticist, assembling knowledge from everywhere into an encyclopedic whole. In chapter V "De graphice" of his *De quatuor artibus popularibus* (1650), for instance, he founds the theoretical section about

"the nature and constitution" of painting on ancient authorities such as Aristotle, Philostratus, Horace, Pliny, and Philo and on "topoi specific to the history of painting and art theory," as Colette Nativel has shown. His division of the popular arts is based on categories taken from Aristotle's *Politica*, whereas in *De philosophia*, many human activities, including painting, physics, and medicine, are explained as philosophical arts.

Vossius's significance for philosophy can be illustrated by his *De theologia gentili*, because it informed the later discussion on natural religion and Deism to a large extent. Vossius's legacy, however, is not easy to assess, because as a polymath, he stuffed his books with observations that others had already made before him; this encyclopedic way of collecting information served the goal of "Bildung" (education) and helped to understand the world. In this way, his oeuvre marks the end of Renaissance thought. Paul Sellin dubbed his introduction to the art of poetry, the *Poeticae institutiones* (1647), "the last of the Renaissance monsters." Vossius wholeheartedly endorsed the idea that it was within everybody's reach to "learn" to write poetry or to produce a painting. This rather formal, mechanical conception of art was at first acclaimed by contemporaries. Later on, it also exerted great influence, for instance, on French dramatic theory, but around 1800, it was superseded by Romantic ideas on "divine" inspiration. Hence the Romantic poet Samuel Taylor Coleridge found his poetics "thoroughly worthless." But it seems rather unfair to conclude in such a negative vein. In the international scholarly world of the Late Renaissance, Vossius continued to exert a thorough influence that stretched well into the eighteenth century. His later fame was greatly stimulated by the careful way in which the eminent printing firm Blaeu in Amsterdam published many of his works, especially the *Opera omnia*.

Vryennios, Iosif

Born: 1350, c. Constantinople

Died: 1431 or 1432, c. Constantinople

Anastasios Mandrapilias

Athens, Greece

Abstract

Iosif Vryennios was a Byzantine monk, scribe, and scholar, who played a distinctive role in Orthodox diplomacy, specifically regarding the union between the Eastern and Western Church during the fifteenth century in Crete, Cyprus, and Constantinople. He also taught in the so-called Constantinople's University of which he became director while holding the

position of the minister of the Imperial Court as well.

Alternate Names

Vryennios, Joseph

Biography

Iosif Vryennios was born in Constantinople approximately in 1350 and died around 1431/1432. The exact time of his birth and death are unknown though, as well as his birth name. He received a thorough education and was considered to be one of the best-educated people of his era. He became a monk and lived in the Stoudiou Monastery at first and in the Charsianitou Monastery later on, both in Constantinople. Iosif Vryennios moved to Crete for approximately 20 years. He was sent there by the Constantinopolitan Church authorities around 1380 because Crete was not allowed to have orthodox high priests due to being under the dominion of the Latins since 1204. Vryennios during his stay in Crete had been a spiritual guide for the Orthodox Cretans without creating any serious clashes. At the same time, however, Vryennios condemned many Cretans who led sinful lives. It was this group that later on accused him of being a subversive monk and succeeded in having him imprisoned and evicted from Crete.

Upon his return to Constantinople, he joined the Stoudiou Monastery and became an instructor at the University. After a while, he was sent to Cyprus, which was under the Latin conquest since 1192. Vryennios arrived as the vicar of Constantinople's throne in 1406, after the Cypriots' request to be reunited with the Constantinople Church, where he discovered that their request was only superficial and the true desire of the Cypriots was to remain subservient to the Latin Church. Despite his attempts to indoctrinate the Cypriots, he did not succeed

and left the island without succumbing to their proposals. Due to his contribution, the union between the two Churches was postponed and remained an open subject. Coming back to Constantinople, Vryennios joined the Charsianitou Monastery and dedicated his time to academic teaching, the indoctrination of the population, and the preparation of the next Ecumenical Council related to the union of the Churches. He became a minister in the Imperial Court, President of the University, and Head of the students' scholarships, and as such he reconnected with a great number of influential persons. He died around in 1431 or 1432 in Constantinople.

Innovative and Original Aspects

Vryennios played a distinctive role in the Church relations field, specifically on the matter of the union. He did not hope for the union to happen, and he fully supported the orthodox faith as the one and only true faith. However, he handled the matter of the union with solemnity, rejecting at the same time every political agenda interfering with its core basis. At the same time, he attempted to teach and guide people to lead a Christian life. His work consisted of many speeches, lectures, letters, and studies dedicated to highlighting the Holy Trinity and the emanation of the Holy Spirit directly from God, the significance of living a Christian life, and arguments against the two Churches' union.

Impact and Legacy

Vryennios' services to Church were of prime importance. He believed that a union between the Eastern and Western Churches would cause alienation of faith and rejection of the orthodox theology and that it was impossible to be accepted by the Orthodox. His work, although nonconfrontational and almost anonymous, had a huge impact, and in it, we can find concentrated

the patristic teachings. Though unsuccessfully, he fought to prevent the Papal proposal for the relevant Ecumenical Council to be convoked in Italy.

Warburg, Aby

Born: June 13, 1866: Hamburg

Died: October 26, 1929: Hamburg

Christopher D. Johnson

The Warburg Institute, London, UK

Abstract

Aby Warburg (1866–1929) dedicated his career to studying the *Nachleben der Antike* (afterlife of antiquity) in Renaissance art and thought. Inventor of iconology as an art-historical method, Warburg later explored other, more experimental methods of making visible what he called the “pathos-formulas” that fueled Renaissance culture. Warburg’s studies of astrological images in the Renaissance, together with his interest in images from Renaissance popular culture, are emblematic of his ambition to create a broad *Kulturwissenschaft* (cultural science). Warburg’s thought and methods have influenced thinkers in many disciplines, from art history to philosophy. The library he founded in Hamburg, now the Warburg Institute in London, is another crucial, vital aspect of his legacy.

Biography

“Ebreo di sangue, Amburghese di cuore, d’anima Fiorentino” (*Jew by blood, Hamburger by birth, and Florentine in spirit*) is how Aby M. Warburg described himself (Bing 1960). Though the eldest scion of a Hamburg banking family, Warburg chose the scholarly life instead. During his university career (1886–1891) at Bonn and then Strasbourg, he studied with the historian of religion, Hermann Usener, the art and economic historian Karl Lamprecht, and the art historians Carl Justi and Hubert Janitschek (Gombrich 1986; Lescourret 2014). An art history seminar in Florence with August Schmarsow in 1888 was also very influential. His dissertation on Botticelli’s *The Birth of Venus* and *Spring* was published in 1893 to great acclaim due mainly to its novel iconological method. In 1895–1896, Warburg traveled to the USA and the Hopi pueblos in the Southwest to observe ritual dances. Upon his return he married the artist Mary Hertz. They lived in Florence from 1898 to 1902, where Warburg did art-historical research, filled notebooks and notecards with his writings, but published very little. Back in Hamburg by 1902, for the next 16 years or so Warburg wrote articles and gave lectures on Renaissance art history, letters,

and, beginning around 1908, the history of Renaissance astrology (Warburg 2013; Lescourret 2014). He also curated his private library, which, with the help of Fritz Saxl (who came to Hamburg in 1913), became in 1921 the *Kulturwissenschaftliche Bibliothek Warburg* (Warburg Cultural Science Library), an indispensable “organon,” as Warburg’s friend Ernst Cassirer dubbed it (Cassirer 2000, xiii) (With the Nazis’ advent, the Library was moved in 1933 to London where it eventually became the world-renowned *Warburg Institute*, which continues to foster research and teaching on all aspects of Renaissance culture.) Deeply disturbed by WWI, Warburg suffered from manic depression, which led to a six-year breakdown, most of it spent in Ludwig Binnschwanger’s Kreuzlingen Sanatorium. Recovered and back in Hamburg by 1924, Warburg, with Saxl’s and Gertrud Bing’s assistance, continued to research and lecture on various aspects of the *Nachleben der Antike* (antiquity’s afterlife). He experimented also with new modes of presenting the fruits of his research, both to reach a wider audience and to obviate long-standing difficulties with academic writing. Warburg never took a permanent academic position; though he did give a few seminars at the University of Hamburg in 1925–1928. He died of a heart attack in October 1929, several months after returning from a nine-month sojourn in Italy made ostensibly to collect materials for his *Bilderatlas Mnemosyne*. Two volumes, containing all his published writings and some of his lectures, appeared posthumously in 1932. Yet his *Nachlass*, which includes the incomplete *Atlas*, is also an essential part of his legacy, as the ongoing-publication of his *Gesammelte Schriften* (Collected Writings) confirms.

Heritage and Breaking with Tradition

In all its forms, Warburg’s work was dedicated to explicating the *Nachleben der Antike*, particularly as it informed Renaissance imagery. His dissertation broke with the aestheticising and formalist art history of his time to invent what he eventually termed “iconology,” which interprets and

historicizes the artwork by adducing contemporary textual sources from various disciplines. (In the 1920s, Erwin Panofsky adapted Warburg’s iconography/iconology to create a more systematic method of producing “synthetic intuition” about the artwork, a method that ultimately aimed for “synthesis.”). However, Warburg also aspired to a broader “Kulturwissenschaft” (*cultural science*) (Wind 1983; Villhauer 2002; Wedepohl 2005). Two essays (1902, 1907) centered on the late quattrocento Florentine patron and banker, Francesco Sassetti, and cast as supplementing Jacob Burckhardt’s cultural history, exemplify this aspiration, as do his studies, beginning around 1907, on the history of astrology. Drawing on an eclectic array of visual and verbal artefacts and borrowing methods and ideas from a wide-range of disciplines (the history of art, literature, science, philosophy, religion, myth, but also contemporary linguistics, anthropology, and psychology), Warburg scoured culture high and low for *pathos formulas*, symbolic expressions which diachronically and synchronically capture the “polarity” between immediate experience and formal abstraction. “[A]n indissoluble intertwining of an emotional charge and an iconographic formula” (Agamben 1999, 90), the *pathos-formula* (aka the *dynamogram*) was Warburg’s most innovative contribution to the theory of the symbol. He traced *pathos-formulas* expressing mourning, suffering, devotion, victory, etc. in Renaissance works, but also in classical, medieval, and contemporary ones. More particularly, Warburg highlighted the exceptional ability of works by Dürer, Mantegna, and Rembrandt to mediate “superlatives,” i.e., “expressive values” fueling a “language of gestures” which had become too exaggerated and so too subjective. He celebrated these artists for how they made style respond to ethical and psychological needs (Warburg 1999, 556–558). “Besonnenheit” (*sophrosyne* or prudent understanding), both in word and image, was the chief virtue of Warburg’s Renaissance (Warburg 1998, I.2.534). Or, as he wrote at the end of a 1927 lecture on Rembrandt: “Jede Zeit hat die Renaissance der Antike, die sie verdient” (*Every age has the Renaissance of antiquity that it merits*) (cited in Johnson 2012, 181).

Innovative and Original Aspects

In mapping the recurrence and variation of *pathos-formulas* in time, space, and across media, Warburg spurned disciplinary borders and adopted a discourse rich in metaphors and neologisms. A brilliant historicist, he assiduously investigated the contexts together with the efficient and material causes of artworks. For example, in an essay on Florentine *intermedi* in 1589 Warburg rejects Nietzsche's account, in *The Birth of Tragedy*, as "fundamentally wrong in relation to the historical process" (Warburg 1999, 544). Yet, especially in his last years, Warburg also mined Nietzsche's recursive philosophy of history. He gave a seminar on Burckhardt, with a final session on Nietzsche, at the University of Hamburg in 1927–1928. For Warburg, Burckhardt and Nietzsche were "catchers [*Auffänger*] of mnemonic waves" and "very sensitive seismographs" (cited in Pfothner 1985, 311). Nietzsche's Dionysian-Apollonian duality is subtly adopted to interpret not just Renaissance art history (Agamben 1999, 97), but also, as the draft Introduction to the *Bilderatlas Mnemosyne* urges (Warburg 2008a, 4), all Renaissance culture. More particularly, a Nietzschean *Pendelbewegung* (oscillation) informs his characterization of sixteenth-century Germany as "the age of Faust, in which the modern scientist – caught between magic practice and cosmic mathematics – was trying to insert the *conceptual space* [*Denkraum*] of rationality between himself and the object. Athens has constantly to be won back again from Alexandria" (Warburg 1999, 650).

In his later years, Warburg experimented with a *Bilderreihe*-technique to make palpable the "Wanderstrassen" or digressive, migratory routes taken over time by *pathos-formulas* and mythological and cosmological motifs (Warburg 2012). A kind of belated *ars combinatoria* or memory theater that relied on metonymy and metaphor to present a wide variety of exemplary images, it was designed to bring historical "expressive values" before the eyes of both specialists and the general public. Drawing from an inventory of several thousand images (mainly from the Renaissance, but also including classical, medieval, and

contemporary objects), Warburg would first select, arrange, and rearrange a handful of images (usually around 20–30) on a large black panel; then individual panels were set in sequences to indicate larger morphologies. In his best known, last, unfinished project, the *Bilderatlas Mnemosyne* (1928–1929), Warburg mapped over the course of 63 panels two themes central to the Renaissance: "the attempt to absorb pre-stamped expressive values by means of the representation of life in motion" in visual art and the process of "Orientation" by which humanity came to understand and figure the cosmos (Warburg 2008a, 3–6). As the self-nominated "psycho-historian" who diagnoses "the West's schizophrenia" through its images (Warburg 2001, 429), Warburg believed that his method could reanimate cultural memories in ways critical not only to the progress of *Geistesgeschichte* but also for his own self-understanding. This conflation of the objective and subjective is epitomized by a passage from his last public lecture in 1929 at the Hertziana library in Rome. In describing how Ghirlandaio in his paintings appropriated the past, Warburg is undoubtedly describing himself as well: "It is a wish-image of one who is burdened by the tradition, who confronts the question whether he can adequately spiritualize and internalize [*einverseelen*], on the one hand, the past's legacy and, on the other, impressions from the living environment. How these wish images, arranged positively or negatively in relation to self-consciousness, selectively have an effect in the artist's attempt at composition, one can only hope to ascertain where both legacy and impressions allow themselves to be demonstrated phenomenologically in their constituent parts of an artist's work" (Warburg 1929, fol. 3).

To undertake this phenomenology, Warburg devised a *Kulturwissenschaft* that eclectically appropriated strands of Renaissance humanism. For instance, Poliziano's Ovidian poems, *Giostra* and *Orfeo*, are the central documents in his interpretation of Botticelli's paintings (Warburg 1999, 89–156), as they helped him formulate the cardinal concept of the "mobile accessory" (*bewegtes Beiwerk*), or how the quattrocento artist subtly

reanimated classical expressive values by depicting the organic motion of hair and clothes (Papapetros 2012). Alternatively, the value of the artistic, but also phenomenological detail, underscored by Warburg's famous motto, "Der liebe Gott steckt im Detail," may well lean on Leibniz's notion of the "petites perceptions" that bind together past, present, and future (Warburg 2015, 115; Heckscher 1974).

Warburg's early theoretical writings, especially the fragmentary *Symbolismus als Umfangsbestimmung* (1896–1901), are indebted to Neo-Kantian thought (Warburg 2015, 317). Yet the Neo-Kantian term *Umfangsbestimmung* (determination of scope), which appears throughout Warburg's writings, concerns not an apriori act of understanding but rather a form of symbolic thought involving physical perception and memory: "Through conscious, subjective incorporation distance [Entfernung] is really destroyed, though it is regained in the mind as consciousness; *consciousness of distance* [Entfernungsbewußtsein] deposits itself in the brain as memory" (Warburg 2015, 315). Instead of leading to concept-formation, *Umfangsbestimmung* is a metaphoric act that fosters an "Entfernungsbewußtsein," which rejects the earlier, magical "identification" of self and world. Warburg outlines three stages of distance-creating *Umfangsbestimmung*: "angleichende" (*adapting, approximating*), "ausgleichende" (*balancing, compensating*), and "vergleichende" (*comparing*). Each is an act of memory essential to culture in general and to Warburg's hermeneutics more particularly. In the first instance humanity produces "ornament" and "instrument"; in the second it cultivates "pictorial art"; and in the third, it discovers the linguistic means to evaluate and critique (Warburg 2015, 311–316). Indebted also to Usener's and Tito Vignoli's Viconian histories of myth, Friedrich Theodor Vischer's account of the symbol, Robert Vischer's empathy theory, and Richard Semon's account of the physiology of memory, Warburg's symbol theory was as capacious as it was syncretic (Pinotti 2001; Zumbusch 2004, 220–224, 232–235).

In contemplating the historical tensions between astrological and astronomical imagery and thought, Warburg anticipated recent

approaches in the history of science and science studies. Complicating the narrative of epistemological progress associated with the so-called Scientific Revolution are the essays, "Italian Art and International Astrology in the Palazzo Schifanoia Ferrara" (1912) (Warburg 1999) and "Pagan-Antique Prophecy in Words and Images in the Age of Luther" (1920) (Warburg 1999), a lecture, "Die Einwirkung der Sphaera barbarica auf die kosmischen Orientierungsversuche der Abendlandes" (1925) (Warburg 2008b), and many plates of the *Bilderatlas Mnemosyne*. In these, enlisting Abu Ma'sûr, Marsilio Ficino, Pico della Mirandola, Girolamo Cardano, Cornelius Agrippa, Philip Melancthon, Johannes Kepler, and others, Warburg contends that classical astronomical thought was transmitted and distorted by Alexandrian, Arabic, and medieval astrological thought, before it regained classical clarity and "Besonnenheit" in the late Renaissance when empirical-mathematical thought successfully mediated "untethered" mythological-magical thinking. Exemplifying this is how Kepler straddled astrological and astronomical worldviews (Warburg 2008b, 123–125); tellingly, Kepler's account of the ellipse in his second law of planetary motion had immense symbolic value for Warburg (Bredenkamp and Wedepohl 2015). Similarly, in 1928 and 1929 during his Italian sojourn, Warburg became convinced that Bruno's thought and imagery constituted a decisive moment in late Renaissance intellectual history. He met with Giovanni Gentile and Benedetto Croce to discuss Bruno, before he seized upon the medieval notion of *synderesis*, or ethical intuition, to explain Bruno's ability to negotiate the polarities of astronomy and astrology, word, and image (Johnson 2012, 194–229). For his part, Cassirer was convinced that Warburg's interdisciplinary approach to a text like the *Spaccio della bestia trionfante* was far more promising than pursuing just the "philosophic history of the problem" (cited in Johnson 2012, 198).

Warburg's wide-ranging interest in anthropological subjects and methods was crystallized in his "Images from the Lands of the Pueblo Indians in North America," a lecture given while he was still in Kreuzlingen – as a test of sorts of his sanity

and his readiness to return to Hamburg. Here, after contemplating the Hopi snake-dance, Warburg turns to medieval Europe and a Spanish astrological calendar where the snake and the “infinity” it represents is transformed into a celestial constellation, into a “mathematical determination of scope.” “Cultural evolution toward the age of reason,” Warburg concludes, “occurs in the same way, as the tangible, coarse fullness of life fades into mathematical abstraction” (Warburg 2010, 554). Arguing by analogy and typology, in this manner Warburg traces the shift from religious ritual with masked dancers and “its monstrous concreteness” to an “invisible” and “systematic linguistic mythology” (Warburg 2010, 557, 565). That Renaissance European culture for Warburg struck the ideal balance between such monstrosity and abstraction remains perhaps his most provocative and fruitful idea.

Impact and Legacy

Given ideas like this one, together with his methodological innovations, and thanks to the ongoing republication of his work and the scholarly boom that has attended it, Warburg is now regarded as one of the twentieth century’s most influential intellectual and cultural historians. But this verdict was already anticipated by E. R. Curtius, who co-dedicated *European Literature and the Latin Middle Ages* (1948) to Warburg – this despite misunderstanding or misrepresenting his friend’s *Kunstwissenschaft*. For his part, Cassirer, who arrived in Hamburg in 1919 to teach at the University (while Warburg was still in Kreuzlingen), mined the library as he turned away from Neo-Kantian philosophy toward a broader, more contingent understanding of thought and culture (Habermas 1997). The result was his three-volume *Philosophy of Symbolic Forms* (1923, 1925, and 1929), which endows the symbol and its mediating “functions” in language, myth, and mathematical science with all manner of phenomenological, cultural, and transcendental meaning. And though Cassirer, in pursuing his historical teleology, progressively strips the symbol of its affective force in ways that Warburg’s own

thought resisted (Didi-Huberman 2002, 440), he was happy to borrow from Warburg when it suited him. Dedicating *The Individual and the Cosmos in Renaissance Philosophy* (1926) to Warburg, he lauds how the Warburg Library has forcefully upheld the “principles” governing “research in intellectual and cultural history.” Further, “[i]n its organization and in its intellectual structure, the Library embodies the idea of the methodological unity of all fields and all currents of intellectual history” (Cassirer 2000, xiii). In the text proper, to explain how Pietro Pomponazzi (1462–1525) balanced ideas about freedom and necessity, Cassirer cites Warburg’s notion of *inversion*, or how in the visual arts the medieval concept of fortune is transformed, and “imbued with a new spirit and new life.” In short, Warburg’s method is exemplary: “In the realm of thought. .. new solutions are not immediately achieved. Before that can happen, it is necessary to create, so to speak, a new *state of tension* in thought. There is no real break with the philosophical past; but a new *dynamic* of thought announces itself, a striving – to speak with Warburg – for a new ‘energetic state of equilibrium.’ Just as the visual arts seek plastic formulas of balance, so philosophy seeks intellectual formulas of balance between the ‘medieval faith in God and the self-confidence of Renaissance man’ (Cassirer 2000, 75–77). In a journal entry contemplating the *Atlas* and its aims, Warburg returned the favour: “Individual and cosmos: exactly my theme as well. Attempt at reformation of pagan ecstasy through metaphoric determination of scope [*Umfangsbestimmung*]” (Warburg 2001, 436). But while for Cassirer Renaissance philosophy was dominated by “the problem of self-consciousness” (Cassirer 2000, 123), for Warburg, Renaissance thought – a more porous, capacious category – was shaped most decisively by the symbolic struggle to establish contemplative “distance” from the world even while preserving the vital connections with the movements animating it.

Georges Didi-Huberman, Warburg’s most philosophically ambitious interpreter contends that with the *Bilderatlas* Warburg invented an ethical way of knowing the *Nachleben der Antike* in the Renaissance, a nonsystematic approach that

is at once “inexhaustible” and “unfathomable,” and thus at odds with the systematic efforts of Cassirer or, for that matter, Panofsky (Didi-Huberman 2010). Seizing upon Warburg’s motto *Per monstra ad sphaeram* (which remakes Kepler’s motto *Per aspera ad astra*) and his phrase *Dialektik des Monstrums*, both of which indicate how medieval and Renaissance astrological thought (to say nothing of Warburg’s own thinking) wrestled with the irrational and the unconscious, Didi-Huberman – drawing on Nietzsche, Deleuze, and Freud – resists any attempt to reduce Warburg’s thought to one or another form of critical *Nachleben* (2002, 2010); instead, for him Warburg offers what a 1929 notebook entry, referring to the *Atlas*, terms a “Kritik der reinen Unvernunft.”

Warburg’s more general influence on art history, cultural studies, and intellectual history has been remarkably widespread and continues to grow. Aside from the so-called Warburg Circle (Saxl, Panofsky, Bing, Edgar Wind, and Raymond Klibansky), Ernst Gombrich, despite great ambivalence, wrestled with Warburg long enough to write his “intellectual biography” (Gombrich 1986). As for philosophy, Giorgio Agamben has become arguably Warburg’s most influential reader. In grappling with the *Nachleben der Antike*, Warburg “aims to configure a problem that is both historical and ethical” (Agamben 1999, 92). Comparing Warburg’s “nameless science” to Leo Spitzer’s “historical semantics,” Agamben affirms that Warburg describes a virtuous hermeneutic circle or “a spiral that continually broadens its turns” (Agamben 1999, 92–96). Elsewhere, essaying the nature of the historical paradigm, Agamben considers Warburg’s “nymph,” as featured in plate 46 of the *Bilderatlas*, and argues that with the plate’s 27 images Warburg is neither searching for origins, nor undertaking iconology. Instead, in combination these images show that the nymph is “undecidable in regards to diachrony and synchrony, unicity and multiplicity. This means that the nymph is the paradigm of which individual nymphs are the exemplars. Or to be more precise, in accordance with the constitutive ambiguity of Plato’s dialectic, the nymph is the paradigm of the single images, and the single images are the paradigms of the nymph”

(Agamben 2009, 29). In this manner, Warburg produces a vital, paradigmatic form of analogical knowledge (Agamben 2009, 31). Further, Agamben suggests that Warburg’s paradigm is grounded in Renaissance philosophy. Noting how Warburg’s “Schifanoia” essay leans on the thirteenth-century, Latin-Arabic *Picatrix*, he argues that Renaissance hermeneutics resembles a magical act of sympathy. By analogy, he concludes, in Warburg’s twentieth-century *Bilderatlas*, individual images do not represent, “[o]n the contrary, they have value in themselves” (Agamben 2009, 55–56).

Water Culture in the Renaissance

Lily Filson
Dipartimento di Filosofia delle Scienze
Formative, Ca' Foscari University of Venice,
Venice, Italy

Abstract

Water supply systems in the Renaissance both recovered classical models (often through the lens of Arabic and Byzantine engineering treatises) and applied this set of principles to

expanded uses which came to characterize the period: hydraulic gardens and games; fountains public and private, miniature and monumental; and interior plumbing systems which revolutionized standards of hygiene and created a clean break from medieval culture for privileged social classes. This entry reviews the transmission and reception of classically derived water supply systems from the Medieval Islamic East, their integration into larger-scale, inventive adaptations created in France and Italy, early fountains and their statuary which anticipated arrangements which became commonplace later in the Renaissance, and the adoption of a system to deliver hot and cold water on tap to the interiors of princely palaces and villas, facilitating new habits of bathing and cleanliness.

Synonyms

Fountains; Hydraulic engineering; Plumbing history; Water gardens

Impact and Legacy

Mirroring other aspects of engineering history, Western civilization's capacity to channel water for both civic and private contexts is generally perceived to have experienced an acceleration of development from the Medieval period onward with the influx of classically derived Arabic and Byzantine treatises. The surviving Sicilian water gardens from the early medieval period which changed hands between Muslim and Christian rulers, such as Al-Zisa of Palermo, illustrate the early counterparts with which Europeans came into contact around the Mediterranean. Hesdin in late thirteenth-century Picardy constitutes Europe's earliest and most extensive importation of water supply systems by a returning crusader for purposes of diversion and delight, anticipating the Renaissance hydraulic systems and devices which characterized princely sixteenth- and seventeenth-century gardens and villas. In Hesdin's works, we witness original features

developed alongside innovative reconceptions of the application of hydraulic engineering principles. Its engines were recognizably the hydraulic automata of Al-Jazari and other treatises which emerged from the Caliphates, reborn in shapes both familiar and foreign (elephants, goats, stags, apes, and singing birds). In the fifteenth century, with Hesdin's refurbishment under the Dukes of Burgundy, a variety of "trick" water jets were introduced, greatly expanding the system of conduits and controls necessary to supplying the dynamic force of water. Monumental, virtuosic expansions of these systems in Italy, at the Villa d'Este of Tivoli, of the Villa Medici at Pratolino, the Villa Lante of Bagnaia, and others, inherited, refined, and applied principles which produced ever-expanded, ever-elaborated networks of pipes, canals, ponds, fountains, and games.

Concurrently, medieval fountains expanded the reach of water supply systems, in some cases restoring a standard of public access to water enjoyed in Roman times (as with the great civic fountains and aqueduct refurbishments, e.g., Siena and Florence) and in others bringing water systems into the private garden and even to the courts and tables of princes, as with the smaller-scale gothic table fountains. A 1365 illustrated manuscript of Boccaccio's *Decameron*, the earliest known of its kind executed during the author's lifetime, contains the depiction of a fountain, with no direct correlation in the text, composed of a hexagonal base, three water spouts in the shape of animal heads, and a nude female figure (presumably Venus) at its top. Whether or not this was an illustrator's interjection drawn from personal experience or rather a direct, allegorical invention by the author himself is a question left unresolved, but nevertheless we have here early indications for the trend of garden fountains which became increasingly ubiquitous.

As with parallel developments in the history of technology in the medieval and Renaissance, fountains and water systems increasingly became fixtures within newly (re)emerging concepts of hygiene and bathing built into Renaissance palaces and villas. The presence of a room or suite of rooms with running water, much less hot and cold

water on tap, for the princes who could afford to have them meant having the luxury of a break from the hygienic standards of their medieval predecessors. Federigo da Montefeltro consciously lived his daily life in emulation of ancient Roman exemplars, and his suite of rooms in the Palace of Urbino featured a *lararium*, a shrine to the household gods, spaces for both reading Greek literature, and physical exercise on the classical model. In fashion by the end of the fifteenth century and a standard fixture of Italian castles, Renaissance bathing spaces were, for elite patrons, transformed into ornate classical fantasies and follies, e.g., the tub room of Julius II decorated by Peruzzi. Cardinal Bibbiena's bath-room painted by Giovanni d'Udine evokes a studiolo with the combination of its small enclosed space, dense iconographical program, and lavish decoration. Hot and cold faucets came from the horns of a satyr's mask; nymphs and other nude female forms with classical identifications were other conventional methods of water delivery in chambers such as these and justifiably so. Water and Venus as life-givers and embodiments of fecundity were intimately entwined. When we encounter the Stufa, either by itself or in its own dedicated grotto at Pratolino, we witness the capacity to bathe in heated waters in imitation of classical, as opposed to medieval, rituals of hygiene.

Weapon Salve in the Renaissance

Sietske Fransen

Centre for Research in the Arts, Social Sciences and Humanities (CRASSH), University of Cambridge, Cambridge, UK

Abstract

The weapon salve claimed to be a cure for the healing of wounds at a distance. On the basis of sympathetic or magnetic powers, the salve supposedly could heal a wound in a clean and painless manner. Attributed to the Swiss physician Paracelsus, this cure was widely discussed in medical and theological circles throughout the sixteenth, seventeenth, and eighteenth centuries. Several disputes over the weapon salve in the early seventeenth century made the alleged cure widely known and widely discussed. The disputes did not revolve around the efficacy of the cure but rather concerned the question of whether the nature of the cure was natural or demonic. As such, these disputes had an impact on the ideas of natural philosophy of the time.

Synonyms

[Army unguent](#); [Magnetic cure](#); [Magnetic unguent](#); [Powder of sympathy](#)

Heritage and Rupture with the Tradition

The weapon salve, attributed to the Swiss physician Paracelsus since the sixteenth century, heals a wound at a distance (Libavius 1597). Instead of applying the salve to a wound directly, the salve was to be applied to the weapon that caused the wound (Camenietzki 2001). The wound then will be cured through the sympathetic or magnetic power of the salve (Clark 1997; Stolzenberg 1998). The recipe for the weapon salve differed throughout the seventeenth century, but almost always contained *usnea* (moss growing on or inside of a human skull) and *mumia* (remnants of human blood and flesh) (Waddell 2003; 2016).

Innovative and Original Aspects

The weapon salve was the subject of a heated controversy in the late sixteenth and seventeenth century (Müller-Jahncke 1993; Thorndike 1958). It was not the effect of the cure that was disputed, but rather the questions of why and how the cure worked. The Jesuit priest Jean Roberti and the Calvinist physician Rudolph Goclenius each wrote several treatises about the weapon salve between 1608 and 1621 (Pumfrey 1987). In the first publication *Tractatus Novus* (1608, with a 2nd edition in Goclenius 1613), Goclenius defended the weapon salve as a natural cure. Based on a Neoplatonic worldview in which sympathetic and antipathetic powers and the relationship between micro- and macrocosm were active, Goclenius explained how magnetic powers could travel by celestial spirit and cure the wound at a distance (see also Debus 1964; Gilbert 1600). For the Jesuit Roberti, this was an unacceptable heresy, and he judged the weapon salve to be demonic and used the subject to write an attack on Protestant heresies in general. The Catholic physician Jan Baptiste van Helmont was involved

at the very end of this discussion by publishing his *De magnetica vulnerum curatione* (1621) in which he opposed the natural philosophy as discussed by Goclenius, arguing that what Goclenius calls sympathy should be explained as magnetism. However, his attack on Roberti was much fiercer. He discussed how magnetism cannot be seen as diabolical but instead is a natural phenomenon. He extended his argument to include an explanation for the efficacy of relics along the same lines. This embroiled him in a lifelong struggle with the ecclesiastical authorities of the diocese of Brussels-Mechelen. He was only posthumously absolved in 1646, 2 years after his death (Pagel 1983).

Impact and Legacy

In the second half of the seventeenth century, the weapon salve remained a topic of discussion (Charleton 1650). A collection of all texts and treatises on the topic was published as *Theatrum sympatheticum* by Sylvester Rattray (1662). In England the weapon salve was discussed in a publication by Sir Kenelm Digby (1658), and only 3 years later, the Royal Society devoted its attention to the topic in one of its meetings (Hedrick 2008).

Weigel, Valentin

Born: 1533 Großenhain

Died: 1588 Zschopau

Andrew Weeks

Illinois State University, Normal, IL, USA

Abstract

Valentin Weigel was a dissenting Lutheran pastor, whose work incorporates various medieval and Renaissance influences in an attempt to justify the freedom of conscience and thought of the layman.

Biography

Valentin Weigel was as limited in movement and outward activity as he was bold in dissent and speculative thought. After completing his university studies in theology in Leipzig and Wittenberg, he served as Lutheran town pastor in the city of Zschopau. While serving with the apparent sympathy of his congregation, he quietly composed treatises and sermons of dissenting theology. Published posthumously during the tension-filled decade preceding the 30 Years' War, these writings earned Weigel a long-standing infamy. His reputation is perhaps best regarded as a measure of the authoritarian petrification of Lutheran

culture in the wake of the mid-century internecine doctrinal disputes, the enforcement of the Lutheran Formula of Concord (1577), and the rising threat of religious war, all of which he vehemently opposed.

The term commonly applied to Weigel's orientation is Spiritualism. In contrast to orthodox Protestantism and Anabaptist dissent, the ideal type of the individualistic Spiritualist disdains the externalities of formal doctrine, sacrament, and ceremony in favor of the divine inner authority of the Holy Spirit or inner word. By its very nature, the Spiritualist type is elusive in comparison with the confession or sect. By the same token, the Spiritualist appears more modern and tolerant. Weigel's absorption of the influences of mysticism (Meister Eckhart, Tauler, and the *Theologia Germanica*), medieval philosophy (Hugo of St. Victor and probably Saint Augustine and Nicholas Cusanus), the nature philosophy of Paracelsus, and the currents of Protestant dissent (notably Sebastian Franck) contributed to an evolving synthesis aimed at arming the thinking lay person against clerical authoritarianism.

Weigel's earliest writings after leaving the university tended toward the eclectic; however, the power of his critical intellect soon began to create something new and whole which, on the one hand, recovered the deeper impulses toward lay opposition and intuition in his sources and, on the other, reformulated the received impulses in response to the post-Reformation era. Already in his *Gnothi seauton* of 1571, the reorientation reveals his well-grounded originality. Restoring a tendency of thought developed by Saint Augustine and Meister Eckhart, Weigel advises the reader to look within to achieve a selfless self-knowledge. Tantamount to a knowledge of God, Weigel's inner knowledge approaches union with God, though this union is rather a daring leap of logic than the outcome of ritual steps of purification. *Gnothi seauton* can be read as an epistemological treatise on sense perception and intuition. It is closer to Augustine and the scholastic Hugh of St. Victor than to Kant and the Enlightenment. Nevertheless, in any full survey of the history of epistemology, Weigel must stand among the adherents of the principle that knowledge is

generated in the knower and not derived from the thing known. In his case, this position in effect responds to the aporia of the Protestant principle of *sola scriptura*: if all truth of salvation derives from the Holy Scripture, how is it possible that various advocates of the Reformation are embracing putatively Bible-based doctrines which are in violent opposition to one another? His response to the religious quandary, more than deliberate borrowing from Platonism itself, drove Weigel to look inward.

Soon after writing *Gnothi seauton*, Weigel was denounced by a fellow Lutheran pastor for questioning the authority of Luther. By carefully defending his views and stressing their general conformity to the Lutheran spirit, Weigel was able to save his position. We can assume that during the standard visitations carried out in every Lutheran territory, his parishioners were asked about the propriety of their pastor. His retention of his position suggests that either his opinions were well concealed or, perhaps more likely, the congregation was on his side. Modern research into the preserved notes from visitation inquiries reveals stubborn popular resistance to the supervisory demands for conformity. Indifferent to doctrinal fine points, parishioners were inclined to close ranks and denounce a pastor for authoritarian behavior or lack of sympathy for the laity regardless of doctrinal considerations. It therefore seems rather likely that Weigel was protected by his congregation. It is certain that he defended them by validating the conscience of the individual.

The mid-1570s saw Weigel's most refined and radical theoretical treatises: *On the Place of the World* (*Vom Ort der Welt*) in 1576 and *The Golden Grasp* (*Der güldene Griff*) in 1578. Both works typically incorporated cosmological, epistemological, exegetic, and devotional themes and ideas. In *On the Place of the World*, the key symbol is that of a cosmos suspended in the infinite void of God: there are no objective coordinates of up or down. Intriguingly, this theme is borne out by some rather concrete cosmological reflections revealing Weigel's interest in the scientific activity of his day. The thrust of his argument is intended to deprive outer reality of its

overbearing solidity, thereby shifting the locus of knowledge and meaning inward. In *The Golden Grasp*, the author again covers a range of themes, but his focal point is that all knowledge occurs in the knower and does not reside in the external object of knowledge. The Bible is an external object whose meaning is only disclosed within the divinely illuminated, therefore selfless and nonauthoritarian, human intellect. The title of the work may be an allusion to Matthias Flacius Illyricus' strict scripturalist anti-spiritualist exegetic work known as the *Aurea Clavis* or "golden key." The metaphor of the "key" was associated with the authority of the church and its power to bind and unbind or to lock and unlock the gate of heaven. Unlike the metaphorically external "key," our "grasp" of truth is intrinsic.

Another work deserves to be singled out for its clarity and originality: Weigel's *Dialogus de Christianismo* of 1584. It stands out both because of its staunch opposition to spiritual tyranny and religious war and on account of its unusual dialogue form between a universalized Preacher and a layman Auditor. The figure of Death (Christ) puts an end to the conversation, as both men pass through deathbed scenes declaring their convictions. Death finds in favor of the Auditor. The Preacher is consigned to a kind of spirit-world afterlife which is his just punishment, though hardly as grim as the orthodox visions of Hell. Here, too, most of Weigel's themes are recapitulated, but the *Dialogue on Christianity* has in addition a certain literary drama to it. It can stand alongside the *Everyman* dramas and *Faust* plays as one of the most powerful judgmental visions of the highly judgmental sixteenth century.

Though these writings are perhaps of greatest interest in philosophy, they are only a portion of his entire work. Weigel wrote cycles of sermons based on biblical texts. We do not know whether they were delivered to his congregation or whether the homiletic form was only a vehicle, rather like the essay form for others. Even the chapters of his more theoretical works consist of sermon-like tracts which sometimes conclude with a prayer or invocation. Weigel was of course

by training and vocation a preacher. His criticism of the pastorate was self-criticism, but this was by no means unusual. Of the countless anticlerical voices of his century, the majority were almost certainly clergymen, just as the ranks of academics today include many critics of the academy. It is also worth noting in consideration of his seemingly modern clarity, tolerance, and antiauthoritarianism that Weigel was very much a man of the sixteenth century who appears to have believed in unobserved supernatural spirits and elemental creatures in the tradition of Paracelsus. Upon the authority of the latter, he accepted an alchemical theory of nature which posited a triune process at the core of created being.

Among the tasks to be completed in Weigel studies, one of the foremost is the evaluation of the writings attributed to him or published under his name. They can tell us much about his impact and early reception. Also of interest is the resonance of his work with the thought of later figures such as Gottfried Arnold and Gotthold Ephraim Lessing, as well as the possible impact of early Dutch and English translations of his writings. It seems likely that such research will arrive at credible conclusions only by exploring his impact as part of larger currents. Looking backward, more needs to be studied regarding his debt to Augustine and Hugh of St. Victor.

Primary literature: Beginning in the nineteenth century, Weigel's writings were recovered and studied in order to restore a voice of early modern dissent which, despite its posthumous delay, still speaks out boldly with surprising clarity and conviction. In the twentieth century, Siegfried Wollgast, a historian of early modern philosophy, strengthened the foundations of Weigel Studies by publishing in one volume the chief writings with a first-rate commentary. Winfried Zeller had already undertaken a complete edition. After Zeller's death, his survey of Weigelian materials undertaken in inauspicious times was deemed inadequate for completion of the project. Based on a more successful search for sources, Zeller's erstwhile assistant Horst Pfefferl began again and at last completed a comprehensive edition.

The most substantial writings were edited by Wollgast in Valentin Weigel, *Ausgewählte Werke (Gnothi seauton, Vom Ort der Welt, Der güldene Griff, Die Predigt vom armen Lazarus, Dialogus de Christianismo)* (Stuttgart: Kohlhammer, 1977). Available in English are *Sermon on the Good Seed and the Weeds, On the Place of the World*, and *The Golden Grasp* in Valentin Weigel, *Selected Spiritual Writings*, trans. and intro. Andrew Weeks, pref. R. Emmet McLaughlin (New York, Mahwah, N.J.: Paulist Press, 2003). Most important of all for the accuracy and scope of its sources and the breadth of its commentary and bibliography is Valentin Weigel, *Sämtliche Schriften* (Neue Edition) (Stuttgart-Bad Cannstatt: Frommann-Holzboog, 1996f.).

Secondary literature: Historical and philosophical context can be found in Siegfried Wollgast, *Philosophie in Deutschland zwischen Reformation und Aufklärung, 1550–1650* (Berlin: Akademie Verlag, 1988). An overview in English of his life, times, and writings is offered by Andrew Weeks, *Valentin Weigel (1533–1588): German Religious Dissenter, Speculative Theorist, and Advocate of Tolerance* (Albany: State University of New York Press, 2000).

White, Thomas

Born: 1592 or 1593, Essex

Died: 6 July 1676, London

Han Thomas Adriaenssen

Faculty of Philosophy, University of Groningen, Groningen, The Netherlands

Abstract

Thomas White was an English priest. As leader of the Blackloist faction in English Catholicism, he aimed to make Catholicism more acceptable to Protestant authorities. In his natural philosophical works, White combined Aristotelian philosophy with the findings of the new science. In his political work, he argued that rulers owe their authority to the

people rather than to God and that states that fail to serve their subjects' best interest lose their legitimacy.

Biography

Thomas White was born in 1592 or 1593 in Essex. Receiving his education at the English Catholic colleges of St Omer, Valladolid, and Seville, White graduated B.D. in Leuven in 1614. Between 1618 and 1623, he taught philosophy and theology at the English college of Douai and between 1625 and 1629 acted as a representative of English Catholics in Rome. Having served as President of the English Catholic college in Lisbon between 1630 and 1633, White spent the early 1640s in Paris, where he associated himself with the so-called Mersenne circle, which acquainted him with such figures as Kenelm Digby, Gassendi, and Hobbes. By 1655, White had returned to England, where he was to become leader of the Blackloist faction of English Catholicism, which was so-called after one of his aliases, Blacklo. Blackloism comprised both a broadly Aristotelian philosophical program and the political ambition of securing toleration for English Catholics by renouncing all worldly power. In theology, White's Blackloism entailed a critique of papal infallibility and the traditional doctrine of purgatory. During the 1650s White continued to pursue his scientific interests, meeting and corresponding with such men as Ward, Wilkins, and Fermat. In 1655, White in his *Grounds of Obedience and Government* advised English Catholics to support the Cromwell regime. Just before the restoration of Charles II in 1660, White withdrew to Holland in 1659, returning to England in 1662. He died in London, on 6 July 1676.

Philosophy

In his early works on natural philosophy, White combined traditional teaching with the new science. Thus, in his 1642 *De Mundo*, White combined aspects of Galilean cosmology with

Aristotelian natural philosophy and the 1646 *Institutionum Peripateticorum* outlined a mechanistic account of bodies within a broadly Aristotelian framework. Bodies were compounds of matter and substantial form. But at the same time, they were constellations of minute corpuscles of the four elements, and their characteristics could be accounted for in terms of the constellation and motion of these corpuscles. White's synthesis of Aristotelian philosophy and mechanism owed a lot to the work of his friend Kenelm Digby, who in his *Two Treatises* of 1644 had claimed that bodies and their operations result from the motion of elementary particles and that this had been the thrust of Aristotle's natural philosophy.

In his *Grounds of Obedience*, White argued that although "the Nature of Man is to be *free*," man chooses to submit to government seeing that this is in his own best interest (White 1655, 6). The subject of a state must see that "what was ordered by the Government, was his owne truest interest" and states that fail to make this clear will in the long run lose their legitimacy (White 1655, 3). Among the *yielding Grounds* most vocal critics was Roger Coke, who reproached Grotius, Hobbes, and White for holding that men are by nature free and that the state derives its authority from the people. Instead, Coke argued that "Men are by nature born into society and subordination" and that the power to rule was divinely instituted (Coke 1660, 53).

As a Catholic, White believed that the text and meaning of the Scripture were too uncertain to function as a rule of faith. Only the unbroken oral tradition of the church could provide doctrinal certainty. Protestants such as John Tillotson and John Wilkins would later argue that certainty beyond a reasonable doubt, or moral certainty, was enough in religious matters, but White would not lower his standards in this way. In his 1663 *Scire, sive Sceptices et Scepticorum a jure Disputationis Exclusio*, he attacked Joseph Glanvill, who had argued that absolute or infallible certainty is not humanly attainable and that though we must aim to rule out reasonable doubts, we will never succeed in the elimination of every possible doubt. According to White, to settle for

moral certainty was to give in to the sceptic, and in the second half of the seventeenth century, White's friend, the Blackloist John Sergeant, would repeat and further develop this line of argument.

Wilkins, John

Born: 1614, Fawsleys

Died: 19 November 1672, London

Han Thomas Adriaenssen

Faculty of Philosophy, University of Groningen,
Groningen, The Netherlands

Abstract

One of the founding fathers of the Royal Society, Wilkins' early natural philosophical works contain defenses of Galilean and Copernican astronomy. Dissatisfied with the ambiguities of natural languages, Wilkins in his 1668 *Essay Towards a Real Character and a Philosophical Language* developed an artificial language. In his *Principles and Duties of Natural Religion*, posthumously published in 1675, he argued that in religion and science, absolute certainty is beyond reach. Moral certainty or certainty beyond a reasonable doubt is all we have and need.

Biography

John Wilkins was born in Fawsley in Northamptonshire, in 1614. Having attended a private school in Oxford, he was admitted to New Inn Hall in 1627, but in October of that same year entered Magdalen Hall, which then had a reputation for Puritanism. Wilkins graduated B.A. in 1631 and M.A. in 1634 and tutored at Magdalen Hall until 1637, in which year he was appointed a vicar in his birthplace. He was ordained priest in 1638 and served some years as a private chaplain to, among others, George, eighth Lord Berkeley and Charles Louis, Prince Elector Palatine, the nephew of Charles I. In 1645, Wilkins was appointed preacher at London's Gray's Inn. During his years in London, he began to meet with a group of scientists often referred to as the Gresham College Group. This group broke up in 1648, the year in which Wilkins became Warden of Wadham College, Oxford. There, Wilkins gathered around him a group of scientists, including some of his former London acquaintances as well as men such as Robert Boyle and Christopher Wren. This Oxford Philosophical Club is often regarded as a forerunner of the Royal Society. In 1659, Wilkins was appointed Master of Cambridge's Trinity College by Cromwell, his brother-in-law, but lost this position 1 year later with the restoration of Charles II. After the restoration, Wilkins held various positions in the Church. His return as a preacher to Gray's Inn in 1660 brought him back to London, where he became a founding father of the Royal Society, serving as one of its secretaries in 1663 and supervising Thomas Sprat's 1667 *History of the Royal Society*. In 1668, Wilkins was appointed Bishop of Chester. Suffering from kidney stones, Wilkins died in London on 19 November 1672 (for a detailed account of Wilkins' life and career, see Shapiro 1969).

Philosophy

Wilkins' earliest writings on natural philosophy are his 1638 *Discovery of a New World* and the 1640 *Discourse Concerning a New World*. These

works do not contain new, but rather aim to popularize Galilean and Copernican astronomy. The latter work was written in response to Alexander Ross, a conservative Aristotelian who in his 1634 *Commentum de terrae motu* had rejected the motion of the earth. In 1648, Wilkins published a treatise on mechanics under the title *Mathematical Magic*.

Wilkins' philosophically most important works are the 1668 *Essay Towards a Real Character and a Philosophical Language* and his *Of the Principles and Duties of Natural Religion*, which was posthumously published in 1675. In the first, Wilkins' project was to develop an artificial language that lacked the ambiguities and redundancies of natural languages. In the first half of the *Essay*, he set out to enumerate all things that his artificial language must be able to denote, offering among others an extensive classification of plants and animal species. The book's second half outlines a system of signs which Wilkins hoped would not only name these things but also reflect their nature and the relations between them. Wilkins' attempt at developing an artificial language may have been inspired by the work of the Scottish scholar George Dalgarno, who in his 1661 *Ars signorum* had set out to construct a universal language. The works of Wilkins and Dalgarno were read with interest by Leibniz, who yet remained critical of the way in which these men had executed their projects.

In the *Principles and Duties*, Wilkins' aim was to defend the principles of natural religion against skepticism and infidelity. To do this, he first distinguished between various degrees of certainty. Absolute certainty, he held, was not humanly attainable. The highest certainty humanly attainable was the certainty of sense perception or physical certainty. The next degree of certainty was the certainty of mathematical reasoning or mathematical certainty. Finally, the lowest degree was that of moral certainty. Moral certainty was certainty beyond a reasonable doubt, and examples of moral certainties are historical matters of fact and the existence of far-away countries.

Explaining that different degrees of certainty suffice in different sciences, Wilkins pointed out that in religious matters, we should not expect or

look for more than moral certainty. The principles of natural religion may not be beyond every possible doubt, but they are beyond a reasonable doubt. And in religion as well as in history and cartography, such certainty was certainty enough. Wilkins here argues as a constructive skeptic: granting the skeptic that absolute certainty cannot be had, he proceeds to claim that this fact is not much to be lamented. A similar strategy and emphasis on moral certainty can be found in the works of Joseph Glanvill and in natural scientists like Boyle, who saw that trial and experiment will never yield absolute certainty, but a certainty beyond reasonable doubt at best (on the concept of moral certainty, see Van Leeuwen 1970).

Will in Renaissance Philosophy, Bondage of

Risto Saarinen

Faculty of Theology, University of Helsinki,
 Helsinki, Finland

Abstract

The phrase “bondage of the will” was coined by Martin Luther in his debate with Erasmus of Rotterdam in 1525. Luther's elaboration of the phrase is theological rather than philosophical, elucidating his basic conviction of justification by faith. Later Lutheran teaching on the will

affirms its qualified freedom in human affairs and denies the will's ability to contribute to salvation. Anglican and Reformed confessional texts teach in a similar fashion. John Calvin takes over Luther's view of bondage and develops it into a systematic topic that is related to Calvin's overall view of divine election and predestination. The Canons of Dort affirm Calvin's doctrine in a strict manner. While Calvinism and Molinism evaluate human bondage differently, both early modern currents interact insofar as they develop complex philosophical theologies that affirm both divine foreknowledge and human responsibility.

Impact and Legacy

The phrase "bondage of the will" (*servum arbitrium*) became famous through Martin Luther's book *De servo arbitrio* (1525) in which Luther attacks Erasmus of Rotterdam's view of human free will. Latin Christianity and philosophy traditionally affirmed a notion of "free decision" (*liberum arbitrium*). Luther took his phrase from Augustine's *Contra Iulianum* (2, 8, 23). In Augustine's late anti-Pelagian writings, the continuing servitude to sin is emphasized. Whether Luther's phrase captures adequately Augustine's theology (Nisula 2012) has remained an issue that continues to create tensions between Protestants and Catholics (Schneider and Wenz 2000).

In early German treatises of the Reformation, the term *arbitrium* was often translated with *Willen* (the will). For this reason, the Latin words *arbitrium* and *voluntas* both tend to be translated with "will" in early modern vernacular texts. While Protestants remained sympathetic to the basic idea of reducing the freedom of the will in religious matters, the traditional doctrinal positions regarding *liberum arbitrium* were also affirmed in qualified ways.

The most influential early normative text of the Reformation, the Lutheran *Augsburg Confession* of 1530, contains an article (§XVIII) "Concerning Free Will" (*Vom freien Willen, De libero arbitrio*). In this article, Lutherans teach "that the human will has some freedom for producing civil

righteousness and for choosing things subject to reason. However, it does not have the power to produce the righteousness of God or spiritual righteousness without the Holy Spirit" (*Augsburg Confession* 2000, 51). Such a formulation does not deviate much from the overall anti-Pelagian tradition of Latin Christianity. Recent study on the reception history of *De servo arbitrio* has shown that early Lutherans understood the bondage of the will in the manner of the *Augsburg Confession*. It was generally considered in Lutheranism that human beings have responsibility of their works and that the fall into sin does not deprive humans of all freedom of choice (Kolb 2005, 285).

Philosophically, Luther's criticism of Erasmus contains two different sets of arguments that are difficult to reconcile with one another. Luther's arguments from God's foreknowledge seem to lead to a strict and comprehensive determinism, as he argues that divine foreknowledge entails a strict predetermination of all later events (e.g., Luther WA 18, 615). Such arguments have, however, little to do with the psychological origins of human bondage. Luther's arguments regarding the origins of human action are more nuanced; they also leave room for indeterminism in ways that the arguments from foreknowledge seem to rule out.

Luther's psychology of action employs a theological dualism between spirit and sinful flesh as its starting point. Carnal people are ruled by sin; they therefore remain in complete bondage. In Christians, however, a continuous struggle between spirit and flesh takes place. As both of these theological principles are heteronomous, Christians are not self-ruling and self-determining persons. They are rather "beasts of burden" that are led by either God or sin (WA 18, 634). At the same time, however, Luther's philosophical psychology assumes that humans are different from beasts and inanimate things in at least three ways.

First, Luther affirms man's so-called natural aptitude, that is, the intentional capacity to receive gifts and even supernatural donations, such as the Holy Spirit. Second, a person has the freedom of choosing ordinary means, such as "the right to use, to do and to leave undone, according to his own choice." Third, with the help of God's grace,

humans can cooperate in all kinds of things (WA 18, 636–638 and 753–754). Philosophically speaking, these three affirmations do not deviate much from those adopted by Erasmus. Luther does not aim, however, at reaching a philosophical position, but he wants to underline the basic teaching concerning justification by faith and the absolute dependence of all humans on external theological powers. Luther's psychological arguments in *De servo arbitrio* lead more or less to the normative position adopted in the *Augsburg Confession*. The anthropological core of this position is the Christian's inner struggle between spirit and flesh.

As a rule, incipient Protestantism does not adopt the phrase "bondage of the will" in its normative texts. Its churches rather speak of *liberum arbitrium*/"free will" and qualify it accordingly. Thus, the *Thirty-Nine Articles of the Church of England* (1562) consider in §10 that not natural powers, but the grace of God makes humans capable of willing and cooperating with God in doing good works. The Puritan *Westminster Confession* (1647) affirms original natural freedom in its §9 "Of Free-Will," saying that "God hath indued [endowed] the Will of Man with that natural Liberty, that is neither forced, nor by any absolute Necessity of Nature determined to do Good or Evil." A sinner loses all ability to will the good, but when God works in the person, "he freeth him from his natural Bondage under Sin; and by his Grace alone enables him freely to will and to do that which is spiritually good." Since the sinful nature does not vanish in the Christian, such action is not yet perfect; some evil tendency remains.

The above-mentioned texts aim at affirming a theological compatibility between human responsibility and human inability to do good. This compatibility is not argued philosophically; rather, the different arguments provide particular elucidations of the basic Reformation conviction that salvation is by faith only and by God's grace only. For this reason, the philosophical coherence of the diverse arguments is not always convincing.

Probably the first ambitious and philosophically subtle defense of simultaneous bondage

and responsibility is John Calvin's *Institutio* of 1559 (esp. II, 1–5). Calvin wants to defend Luther's reading of the strictly anti-Pelagian Augustine, showing that humans sin of necessity but without compulsion (II, 3, 5) and that the will must be made wholly dependent upon grace (II, 3, 14). While Calvin's final arguments for the bondage of the will are scriptural rather than philosophical (II, 5), he clearly aims at a coherent theocentric compatibilism in which everything serves the purposes of God. All actions are finally caused by God, but Calvin considers that actions can nevertheless be co-assigned to humans. For this reason, humans work willingly and are responsible beings, although they do not have any free choice of the will (II, 4, 2).

The doctrine of bondage has its most elaborated form and greatest philosophical and theological impact in strict Calvinism. The *Canons of Dort* of 1619 are the most important normative explication of this doctrine. These canons connect the doctrine of divine election and predestination with the bondage of the will. They refute the view that humans simply start to employ their own powers after receiving the grace of God. At the same time, they concede that when the renewed will is moved by God, it also moves itself (*a Deo acta, agit et ipsa*: 1619, 3–4, 12). In this manner, even the strictest form of Calvinism holds that renewed human beings are capable of voluntary action.

While the phrase "bondage of the will" is typically Protestant, the issues of human powerlessness, the omnipotence of God in salvation, and predestination were also discussed in early modern Catholicism. Catholic spiritual thinkers like Cornelius Jansen, Mme de Guyon, and Francois Fénelon are relevant in this respect. Philosophically, Calvin's attempt to combine predestination, bondage of the will, and human responsibility led Calvinist theology into the neighborhood of Molinism. Luis de Molina's attempt to show the compatibility of God's foreknowledge and human free will with the help of the concept of middle knowledge (*scientia media*) was discussed actively in early Calvinism (Muller 2006). While the issues of bondage and determinism became prominent in the early modern period, the phrase

servum arbitrium was never so frequently employed as its classical counterpart *liberum arbitrium*.

Remarkably, Molinist and Calvinist issues regarding the compatibility of determinism and freedom continue to be prominent in today's philosophy. Leading Christian philosophers such as Alvin Plantinga and Peter van Inwagen investigate compatibilist arguments and the Calvinist claim of final divine-human cooperation (Tooley 2012, ch. 9). In a somewhat paradoxical manner, the early antagonism between Luther and Erasmus has led to later convergences between Calvinists and Molinists.

Will in Renaissance Philosophy, Free

Risto Saarinen

Faculty of Theology, University of Helsinki,
Helsinki, Finland

Abstract

Renaissance philosophy receives the patristic traditions of Augustine and Bernhard of Clairvaux as well as the scholastic teachings of Thomas Aquinas and John Duns Scotus. In the fourteenth century, the moderate voluntarism of John Buridan and the consistent voluntarism of William Ockham become dominant new currents. Along with these, Thomas Aquinas's view of human action continues to exercise a great influence in the fifteenth and sixteenth centuries. Many Renaissance authors develop an interest to the issues of fate and fortune, teaching that human free will is an exception to the general rule of fate and providence. Fatalist and determinist views of John Wycliff and Lorenzo Valla are normally rejected. Erasmus of Rotterdam argues that free will can be defended on both moral and biblical grounds.

Martin Luther and John Calvin want to downplay the significance of free will in religious matters. After Philip Melancthon, early Lutheranism nevertheless affirms free will in nonreligious life. While Calvinism teaches predestination, it also wants to affirm human moral responsibility, sometimes approaching Neo-Stoicism. The Council of Trent affirms the existence of free will (*liberum arbitrium*). Luis de Molina's doctrine of "middle knowledge" (*scientia media*) aims at proving that God's foreknowledge does not rule out human free will. Francesco Suarez and René Descartes affirm similar positions. At the same time, early modern natural science underlines determinist causality. In Renaissance literature, authors like Marsilio Ficino and William Shakespeare, portray a many-sided will that establishes flexible individual identities.

Synonyms

Free choice; Free decision; *Liberum arbitrium*

Impact and Legacy

Augustine and Bernard of Clairvaux continue to be philosophical and theological authorities through the Renaissance and Reformation period. In his *De libero arbitrio* (e.g., 1, 11, 21), Augustine teaches that human free decision or choice (*liberum arbitrium*) integrally belongs to the will (*voluntas*) so that the will is in some sense free (Augustine 1865). While decision and will are thus conceptually distinguished from one another, free decision is predominantly considered to be an act of the will in the Augustinian tradition. The vocabulary of free will is, however, complex for many reasons. Sometimes *voluntas* means for Augustine simply a power or desire. In his late anti-Pelagian writings, he restricts the freedom of the will because sinful concupiscence prevents people from doing good. Finally, in his *Retractationes* (1, 9, 3–6) Augustine considers that his *De libero arbitrio* remains compatible with his later anti-Pelagian stance.

Among the many different expressions that Augustine uses to depict the free decision of the will, “consent” (*consentire, consensio*) often means a free and responsible act. He states, for instance, that we do not sin in feeling the evil desire but in consenting to it (*ex prop. Rm 12, 8*). The dichotomy between inevitable desires and free consent is a recurring feature of later Augustinian traditions.

In his *De gratia et libero arbitrio* Bernard teaches that the human will inevitably contains an aspect of freedom: “Where the will is, there is freedom” (*ubi voluntas, ibi libertas*) (Bernard 1993, 1–4). This is so because the person who laments his lack of good will already experiences some freedom from necessity. While all rational creatures possess this kind of freedom, its higher degrees, freedom from sin and misery, need divine help in order to emerge. For such reasons, Paul’s lament in *Romans 7* does not falsify free will but

rather proves that the speaker is free from necessity. Divine help is, however, needed in order to accomplish the good.

The Aristotelian scholasticism of the thirteenth century introduces a theory of human action in which rational deliberation is made responsible for intentional action. Thomas Aquinas and many others adopt the so-called practical syllogism, a calculative model of human action. Within this framework, the place of free will becomes again an issue of debate. The so-called Parisian articles of 1277, promulgated by the Bishop of Paris, Etienne Tempier, aim at preserving Augustine and Bernard’s notion of free will within new Aristotelian paradigms of action. The articles condemn various views according to which reason determines the human will so that it cannot act contrary to reason or exercise a freedom of its own. Even sixteenth-century authors like John Mair still feel the need to state their conformity to the Parisian articles (Saarinen 2011, 27–35, 83–95).

Late-medieval Franciscan thought refined the idea of free will. In many ways, John Duns Scotus and William Ockham constructed that philosophical concept of free will which is familiar to us in modern discussions. Scholars have paid attention to the terminological point that until 1270 writers discussed *liberum arbitrium*. After that date, the expressions *voluntas libera* and *libertas voluntatis* also came into use. Franciscan authors often defended an idea of the will as the ruler of the soul; in this view, reason acts as the will’s adviser (Kent 1995, 98–99).

John Duns Scotus takes over from Anselm of Canterbury the distinction between two affections of the will, *affectio commodi* and *iustitiae*. While the first affection seeks one’s own advantage and happiness, the second seeks universal justice. Because the will is free and also possesses the affection that transcends the quest for one’s own happiness, free will can prefer justice over happiness. This idea gives voluntarism and free will a broader scope than in earlier Augustinian and Aristotelian traditions. For Scotus, the will no longer needs to serve the drive for self-realization and advantage, but it can freely will what is morally right (Kent 1995, 193–198).

William Ockham's voluntarism can be considered as the apex of late medieval ideas of free will. For Ockham, freedom basically means the possibility to choose between opposite alternatives. While volition requires some sort of cognition in order to be connected with objects, such cognition and belief are not the cause of volition. At most, cognition may guide or facilitate volition, but the willing agent freely performs the acts of free will. The possibility to opt for opposite choices means, among other things, that the free agent must always be able to act against what he takes to be the right or good (Panaccio 2012, 90–91). In this manner, the positions of Duns Scotus and Ockham enable the conceptual analysis of situations in which the will freely and consciously chooses against one's own interests and contrary to what is right.

The standard teaching on free will in the fourteenth century is contained in the third book of John Buridan's *Questions on Aristotle's Ethics* (1968). This work continued to be printed in the sixteenth and seventeenth centuries and its influence is visible in many early modern sources. Most importantly, it represents a sort of *via media* that connects the Aristotelian theory of Thomas Aquinas with emerging late medieval voluntarism. Buridan also pays detailed attention to the Parisian articles and the older tradition of Augustine and Bernard.

Buridan starts his discussion by stating that we need to believe in a so-called freedom of opposition (*libertas oppositionis*) as a doctrine of faith and moral responsibility. While this statement resembles the position of Ockham, it may, historically speaking, simply relate to the necessity, for a philosophy teacher, to express his agreement with the Parisian articles. For Buridan, the freedom of opposition means that "it is possible for the will, everything else being equally disposed, to choose sometimes one of the opposites and sometimes the other." Buridan interprets this view to mean that in the state of not-willing (*non velle*) there can be at least two mutually exclusive options open to the agent (Buridan 1968, 36rb–37va).

This option of not-willing is affirmed by the Parisian articles as a sufficient condition for the will's freedom. Buridan (1968, 36vb) quotes the

Parisian view stating that it must be possible for the will not to will when other natural conditions for its movement are present. Such freedom of *non velle* also plays a role in John Duns Scotus (Kent 1995, 193). In order to explain what this freedom means, Buridan (1968, 41va) asks "whether the act of volition or nolition is preceded in the will by some other act or any other mediating disposition through which the act of volition comes into being in the same will."

Buridan undertakes an important distinction between the first and the second acts of the will. In its first act, the will judges something under the aspect of goodness or badness and develops a liking or disliking of its object. This happens inevitably and does not necessarily lead to an action. In its second act, the will accepts or refuses the object thus presented. This second act prompts the action. The agent is morally responsible for this second act. In order for the second act to emerge, the first act must have occurred. At the same time, the will can postpone its second act to inquire further about the alternatives. This is the freedom of not-willing (Buridan 1968, 42rb–44vb).

The will can choose something that is only judged to be good "in some sense." In other words, the will is free to choose in situations of uncertainty and ambiguity. The option of postponement is not unlimited: at some point, it would obviously be irrational to delay decision-making (1968, 44vb). This means that Buridan can have a *via media* position between intellectualist Thomism and voluntarist Franciscan thinking. On the one hand, the will always follows the rational judgment. On the other, however, the will is free to postpone its action to an extent; the will is also free to choose one of several options when each one of them appears under some aspect of goodness but none of them is compelling. For instance, weakness of will can occur in situations of uncertainty, but not when the case is clear (for this, see the entry ► "Will in Renaissance Philosophy, Weakness of"). The freedom of opposition pertains to situations in which the agent can at least for a while stick to the option of not-willing.

Buridan's distinction between first and second acts of the will resembles the Augustinian

distinction between inevitable desires and free consent. At the same time, Buridan develops the distinction towards a Scotist view: both acts are acts of the will, and the second act has the capacity to consider universal reasons that reach beyond one's own advantage. In addition to these features, Buridan's view has a certain affinity to Thomism: the will acts rationally, the decision-making leading to action is performed through practical syllogism, and some ignorance inevitably belongs to wrong choices – though they cannot be excused on such grounds.

Martin Luther's teacher Bartholomaeus Arnoldi de Usingen adopts Buridan's view of human action and considers that the "freedom of opposition" is the Catholic way to speak of free will or decision: "According to both moral philosophy and the Catholic way of speaking the sinful act proceeds from free decision insofar as the agent can consider other alternatives. And according to Augustine, sin is thus free; and if it does not come about freely, it cannot be sin" (Usingen 1499, 63v). One fascinating aspect of this view is its similarity to economic models of decision-making: after the introduction of a variety of available options in the first act of the will, reason can still calculate their different relative benefits in its intermediate state of *non velle*. When the agent freely chooses the best option in the second act of the will, this rational choice normally represents the optimal amount of what is considered advantageous and/or right (Saarinen 2013).

Recent research on Renaissance philosophy has shown that the new commentaries on Aristotle often continue to promote late medieval scholastic views, though in more elegant Latin. From 1300 to 1650, the views of Aristotle and Thomas Aquinas on human action continue to be widespread and are often regarded as the standard position in academic teaching (Lines 2002; Lines and Ebbersmeyer 2013). This basic fact should be remembered as the background from which new and innovative discussions emerge.

Some Renaissance authors develop an interest towards the issues of fate and necessity. In his *De remediis*, Petrarch takes a critical stance towards

wishful thinking in general and astrology in particular. He criticizes fortune-tellers (Petrarch 1991, ch. 112) and then remarks to those who hope for better times that "happiness or sadness depends not on the times but on you yourself. As soon as you realize this you will know how to hope for happy things, and how to cope with sad ones" (1991, ch. 115). In Petrarch's *Secretum* (1989), this voluntaristic stance is investigated more closely.

In his *On Fate and Fortune*, Coluccio Salutati defends a view according to which natural things happen necessarily (Salutati 1985). Will, however, is an exception to the general course of nature:

Will alone, the potential of rational creatures, is bestowed with freedom of decision, so that it were not at all if it were deprived of freedom (which is impossible), freedom, that is, in choosing to will or nill, which appertains to us so naturally that it were not wrong to state that, if God would take it away, it would not be will anymore. (modified from Blum 2010, 57)

In spite of this voluntarism, Salutati teaches that free will is embedded in God's providence. Fate is the totality of cooperation taking place in the acts of God and humans (Blum 2010, 59–60).

In his treatise *De libero arbitrio*, Lorenzo Valla teaches, on the one hand, that God's foreknowledge does not entail necessity (Valla 1934). On the other hand, the work also contains an anti-intellectualist defense of a religious view according to which God hardens some hearts but not others. Salutati and Valla do not aim at reaching a philosophical solution to the problems of free will; they rather elucidate the issues from various angles (cf. Copenhagen and Schmitt 1992, 212–213; Blum 2010, 55–94). Some late scholastic thinkers, for instance, John Wycliffe, present a stronger doctrine of predestination than Salutati and Valla. The later reputation of Wycliffe and Valla shows that their views of fate and predestination were generally rejected in the Catholic Church. In this sense, free will was considered to be the standard Catholic doctrine.

In later Renaissance philosophy, the compatibility of fate and free will could nevertheless also be defended. In his *De fato, de libero arbitrio et de*

predestinatione, Pietro Pomponazzi (1957) considers that contingent natural events in reality follow the laws of nature, being deterministic in this sense. In an analogical fashion, the human will does not initiate its own freedom but is rather determined by the intellect as Aristotle has shown. Like Buridan, Pomponazzi thinks that the freedom of the will is not found in any positive exercise of choice but rather in the will's capacity of not-willing. While Pomponazzi leans towards a Stoic conception of fate, he considers that the free will can be made compatible with this conception when it is understood as the power to suspend its own act (Poppi 1988, 659). Deterministic features of human action were also sometimes supported with the authority of Aristotle and Thomas Aquinas on the grounds that they do not ascribe the capacity of self-determination to the will.

Erasmus of Rotterdam (1969) undertakes an extensive defense of free will in his treatise *De libero arbitrio*. Erasmus was writing against the early Lutheran Reformation, which was critical of the scholastic view of free will (for this, see the entry ► “Will in Renaissance Philosophy, Bondage of”). Like his Renaissance predecessors, Erasmus does not want to present an overall philosophical solution, but elucidates the issue from various angles. He first says that the problem of free will is a profoundly mysterious labyrinth (1969, Ia1). The ancient authors give a variety of different opinions in this matter. While Erasmus is somewhat uncertain of his own position, he believes that human free decision is effective in some sense (Ia5).

Erasmus considers that most Church Fathers have affirmed free decision. Among those who have rejected it, he counts Mani, Wycliffe, Valla and Luther (Ib2). Erasmus considers that Pelagius gave too much credit to free decision and Scotus also ascribed a high value to it; compared to these, his own position emphasizes grace but nevertheless leaves some room for free decision (IV16). Erasmus grants that we do not know the depths of God's providential rule and thus cannot falsify the doctrine of predestination. In practice, however, it is prudent to teach free decision, since this doctrine motivates sinful people to improve their lives (Ia8-10). The philosophical grounds of free will

are thus moral rather than metaphysical or theological.

Erasmus devotes many pages of his treatise to discussing biblical verses that speak in favor of free will. Such verses include, for instance, Matthew 19:17, 19:21, and 23:37. In these verses, Jesus makes an appeal to people's will. If humans have no free will, such an appeal makes no sense (IIb1). Erasmus underlines his anti-Pelagian stance by concluding that God's grace gives human will its effective power. If someone opposes him by saying that such a weak concept of free will is useless, Erasmus responds that the ideas of humanity and free will distinguish the divine-human cooperation from the mere production of artifacts (IV16). Erasmus' concept of free will thus remains modest and moderate when compared to the voluntarism of Duns Scotus and Ockham.

Luther's closest colleague Philip Melanchthon sides with his mentor in the controversy with Erasmus. At the same time, the Melanchthonian wing of the Reformation accepts many Erasmian teachings. The basic interest of the early Lutherans is concerned with the “noneconomic” mode of understanding human action in salvation: our works do not merit anything, and we are justified by grace alone. A free will that aims for an “economic” gain is thus rejected; however, it is obvious that theories of human person and action also have other aims. Melanchthon is clearly aware of them and develops a differentiated view of free will (Saarinen 2011, 2013).

In his last doctrinal treatise, *Responses to the Articles of the Bavarian Inquisition*, Melanchthon (1955) lays out this differentiated view. He repudiates the Stoic and Manichean views of fate and predestination. At the same time, he rejects the Pelagian view of free will. Melanchthon affirms a nontheological free will: “In human beings who are not reborn there is some freedom of the will which is able to perform external works. Achilles was able to control his hands, so that they would strike Agamemnon, and he could compel them not to strike him” (quoted from Kolb 2005, 98). Philosophically, Melanchthon opts for a kind of fideistic compatibilism: “There is contingency, and the source of contingency in our actions is the

freedom of the will. . . . Both propositions must be believed: there is divine determination, and there is contingency, and not every point of contradiction between the two can be explained” (quoted from Kolb 2005, 99).

For the history of philosophy, it is important to see that Erasmus and Melancthon were tremendously influential as authors of basic university textbooks in the sixteenth century. While they remained on opposite sides of Protestantism as it was then emerging, they both represent a *via media* on the issue of free will, claiming that it is free will that allows humans to be considered something more than mere artifacts. In addition, free will makes it possible to reject fatalism and teach human responsibility. At the same time, these leading humanists do not teach voluntarism or human decision-making in terms of economic rationality. Rather, they grant that we do not really know the basic motives of human action and that free will is, therefore, something that needs to be believed rather than demonstrated.

The official Roman Catholic teaching on free will, as defined by the Council of Trent, is fairly similar to the view of Erasmus. As the early modern Catholic authors needed, at least in theory, to formulate views that were compatible with the Church, it is instructive to quote the essence of this official teaching:

If anyone says that a person's free will (*liberum arbitrium*) when moved and roused by God, gives no co-operation by responding to God's summons and invitation to dispose and prepare itself to obtain the grace of justification; and that it cannot, if it so wishes, dissent but, like something inanimate, can do nothing at all and remains merely passive; let him be anathema.

If anyone says that, after the sin of Adam, human free will was lost and blotted out, or that its existence is purely nominal, a name without substance, indeed a fiction introduced into the church by Satan: let him be anathema. (Council of Trent 1990, canons 4–5 concerning justification)

Philosophically, these statements commit a Catholic author to affirm free will. Remarkably, the normative Protestant doctrine does not deviate much from this, at least when considered in terms of philosophy. Lutherans normally affirmed a concept of “civil righteousness,” according to which human beings can operate with free will in their

nonreligious behavior. Calvinists, on the other hand, tended to evolve towards philosophical compatibilism: while they affirm predestination and human bondage under sin, they also teach that actions can be co-assigned to humans. Therefore, when the will is moved by God, it also moves itself (see the entry ► “Will in Renaissance Philosophy, Bondage of”).

Perhaps the most sophisticated innovation of the sixteenth century regarding free will is formulated by Luis de Molina in his *Concordia liberi arbitrii cum gratiae donis*. In this work Molina (1876), a Catholic author, introduces his doctrine of “middle knowledge” (*scientia media*), that is, God's knowledge of future conditionals of the type “If A were in situation S, A would freely do X.” This knowledge is “middle” in the sense of existing between necessary truths and all particular possibilities. To grant A free will, God does not predetermine all particular possibilities through divine foreknowledge. However, through middle knowledge, God knows all conditionals that relate to possible situations.

To put the doctrine as simply as possible: because of this knowledge of future conditionals, God knows in advance what everybody would do, but humans nevertheless choose freely to do it. Molina argues that such middle knowledge does not extinguish free will. On the one hand, God's foreknowledge is not directly applied to particular possibilities and thus does not predetermine them. On the other, God knows everything in advance, since the conditional sentences of middle knowledge allow God to know what A would freely do in every situation that A encounters.

Molina's position was extensively discussed in both Catholic and Protestant circles of the late sixteenth and early seventeenth century. The primary relevance of these discussions does not concern free will, but themes like theodicy and the semantics of possible worlds. While Calvinists rejected Molinism for the most part, they also became aware of the need for compatibilist solutions that preserve both God's foreknowledge and human responsibility. Molina's views found support in Arminian and Socinian wings of Protestantism, that is, in movements that wanted to

preserve human free will and therefore distinguished themselves from orthodox Calvinism (Muller 2003, 411–432).

Among Catholics, Francesco Suarez adopts a modified version of Molina's middle knowledge. Suarez considers that the freedom of the will is not an aspect of the will's rationality; rather, the will moves itself and can choose among a variety of different options in this fashion (Ramelow 2004, 776). René Descartes defends free will and compatibilism in ways that bear a certain resemblance to Molina and Suarez. Descartes writes: "That there is freedom in our will is so evident that it must be counted among the first and most common notions that are innate in us . . . we have such a close awareness of the freedom . . . which is in us, that there is nothing we can grasp more evidently or more perfectly" (Descartes 1644, I, 39, 41, quoted from Sleight et al. 1998, 1206).

The new mechanistic and geometric ideals of early modern science tend to promote determinism or at least postulate a radical gap between human free action and mechanistic course of nature. Renaissance discussions of fate and fortune, discussed above, anticipate these early modern solutions to some extent. In the late sixteenth and early seventeenth century, Neo-Stoic authors support similar views.

In his *De constantia* (1586), Justus Lipsius summarizes many basic views of Neo-Stoicism. Lipsius considers that fate and providence steer the world and that many natural events therefore follow their necessary course. People should show steadfastness and endurance against the rule of fate. These virtues emerge through active work; at the same time, the free will displayed in such behavior is not limitless freedom of choice but rather the capacity of mastering oneself within the limits of natural necessities. The Neo-Stoic views regarding fate, fortune, and necessity often focused on the interactions between seemingly free human will and the deterministic course of nature.

Another typical and distinctive theme in the Renaissance philosophy of free will concerns the inner struggle. This discussion has its roots in ancient and medieval philosophy. At least three kinds of inner conflict can be observed in this earlier discussion, namely (i) oscillation, a state

in which the mind repeatedly changes its decision, (ii) vacillation, a state in which the mind cannot establish a fixed decision, and (iii) lack of self-control, a state in which the mind fails to maintain autonomy (Price 1994, 3–5). All these variants continue to be discussed during the Renaissance and the Reformation. They are also influenced by the Neo-Stoic ways of dealing with harmful emotions (Saarinen 2011).

In addition, two other variants may be observed, namely (iv) an inner struggle with powers that do not represent the mind or the self, and (v) a struggle in which the old self becomes replaced with a new self. These two variants are connected with religious doctrines, as the struggle against sin or the conversion event, but they are also distinctly philosophical views that elucidate the powers of the will. Neo-Stoic steadfastness in facing destiny, for instance, can be understood as an instance of (iv).

In his *Ethices christianae libri tres* Lambert Daneau (1583) develops a new view of ethics as theological discipline. Daneau argues that Aristotelian virtue ethics is impossible since all humans continue to struggle with harmful desires and thus cannot reach true virtue. The highest goal that we can reach is continence, a strong-willed continuous struggle. This achievement Daneau calls *virtus luctans*, wrestling virtue. As a Calvinist and Neo-Stoic he does not really believe in free will, but he teaches that the moral responsibility of human beings nevertheless concerns a steadfast prevailing in this wrestling (Saarinen 2011, 188–200).

Daneau takes over the old Augustinian view of two wills that struggle within a person. He interprets this idea so broadly that "we then clearly perceive as if two persons (*homines duo*) and two wills were active in us." The continent person can observe the enemy as another person: "When the virtue and the holy desire to do good, which the Spirit of God gives, prevail in this wrestling, the will remaining repugnant, it is called continence. Such is the case of Jacob wrestling with the angel" (Daneau 1583, 104v–105r). In this manner, the strong alienates or "outsources" other powers from itself.

The change of identity as a result of inner struggle (v) is often used as a literary theme of

the Renaissance. Marsilio Ficino's *De amore* (1985, II, 8 and VI, 10) depicts love as a passage through death: when I fall in love, my beloved takes my soul away so that I die. When my beloved gives my soul back, my new life begins. This means, however, that the beloved is also a murderer, so that I both love and hate my beloved. Ficino writes:

You would not want to be with this murderer of yourself, but you do not want to live without his blessed sight. . . . You would certainly not want to love, O madman, because you do not want to die. You would also certainly not want not to love since you think that service must be rendered to an image of heavenly things. (Ficino 1985, VI, 10)

When Ficino here uses the Latin word *nolles* four times, he underlines the fluctuating identity of the willing person. In some sense, the act of the will defines the identity of the person. At the same time, the events of willing and “nilling” (*nolle*) prove to be a source of both joy and sorrow so that a plural identity emerges.

Shakespeare's *Sonnets* (1609) may be the most prominent Renaissance source in which the plurality of wills (and Wills!) is elaborated and taken as a basis of shifting identities. Sometimes Shakespeare can describe an inner struggle (in the sense iii or iv) in almost Puritan or Calvinist terms, as in *Sonnet 146*:

Poore soule the center of my sinfull earth,
My sinfull earth these rebbell powres that thee array,
Why dost thou pine within and suffer dearth
Painting thy outward walls so costlie gay?

Other traditional instances of inner struggle (in the senses i–iii) include, for instance, the famous verses “Such civill love is in my love and hate” (35) and “Two loves I have of comfort and dispaire” (144).

The *Sonnet 136* employs sexual imagery to draw a stunning picture of the interplay of soul and will. In this interplay, the soul remains little more than a blind platform on which the various wills exercise their activities so that identities are shifted (v):

If thy soule check thee that I come so neere,
Sweare to thy blind soule that I was thy Will,
And will thy soule knowes is admitted there,
Thus farre for love, my love-sute sweet fulfill.
Will, will fulfill the treasure of thy love,
I fill it full with wils, and my will one . . .

Shakespeare does not aim to take a philosophical stance but presents a playful variation of complex identities that appear as a plurality of wills. *Sonnet 135* attempts an even greater complexity of identities (v) than *Sonnet 136* quoted above. Like many other Renaissance authors, Shakespeare is more interested in elucidating the problems of will from different angles than solving them. At the same time, however, the literary productions of the Renaissance are not completely detached from philosophical views. Shakespeare's use of inner struggle and his interplay of love, hate, and will connect him with Ficino and the broader intellectual tradition of inner wrestling.

In sum, the innovative and original aspects of Renaissance thought concerning free will do not constitute a grand narrative but rather a variety of short stories. There is, first, the story of moderate voluntarism that comes from Aquinas and Buridan to Pomponazzi and Erasmus, being continued by the Council of Trent. A more radically voluntarist trend comes from Scotus and Ockham to Molina and Suarez; this may be the most ambitious story philosophically. The Protestant story wants to downplay voluntarism, but finally it affirms free will in the moderate fashion of Melancthon and Neo-Stoics. The literary story of Ficino and Shakespeare highlights love and flexible identities, while borrowing from philosophical traditions.

The impact and legacy of Renaissance views is also manifold and scattered along diverse paths. Philosophically, the Molinist elaboration of contingency and freedom continues to be discussed until the present day. In contemporary analytic philosophy, the semantics of possible worlds employs ideas that resemble Molinism. In theology, free will is often seen as an issue that divides different Protestants from each other as well as from Roman Catholics. As the positions of Erasmus, Melancthon, and the Council of Trent are, at least philosophically, fairly similar, the differences in this issue may have been exaggerated in the teaching of the churches.

Probably the most important legacy of the Renaissance at this point concerns the new literary and artistic ways of understanding human freedom and inner complexity. Authors like Ficino

and Shakespeare develop creatively various themes that they receive from scholarly traditions. Due to the literary creativity of the Renaissance, an increasingly individualistic patchwork of love, freedom, and many-sided will emerges. This patchwork is no longer philosophical in itself, but it needs to be understood against the broader Western intellectual tradition of free will.

Will in Renaissance Philosophy, Weakness of

Risto Saarinen

Faculty of Theology, University of Helsinki,
Helsinki, Finland

Abstract

Weakness of will (akrasia) continues to be actively discussed in the Renaissance and the Reformation. Important treatises are written by John Buridan, Petrarch, John Mair, Josse Clichtove, Joachim Camerarius, Francesco

Piccolomini, and Lambert Daneau. The dominant Aristotelian framework is complemented by Neo-Stoic and Platonic considerations. Increasingly voluntarist interpretations gain ground, stressing the “clear-eyed” nature of some akratic choices. While the practical syllogism continues to be employed, its overall significance for the explanation of human action decreases. Typical of early modern discussions is an inner wrestling between various rational arguments, or between reason and emotional perturbations, or between spiritual and carnal aspects of humanity. The uncertainty of human knowledge and the decisive importance of particular facts are emphasized more strongly than in classical and medieval discussions.

Synonyms

[Akrasia](#); [Incontinence](#); [Moral weakness](#)

Heritage and rupture with the tradition

Weakness of will, sometimes called with the Greek term *akrasia* or the Latin term *incontinentia*, depicts the phenomenon of acting against one’s better judgment, that is, the situation in which one knows the good one ought to do but nevertheless does something else. A person who does the good while also having harmful tendencies is called continent or enkratic. Virtuous and vicious people do the good or the evil without any inclinations to the contrary. The concept of *akrasia* has its origins in Book VII of Aristotle’s *Nicomachean Ethics* (EN), in which this phenomenon is discussed. Since knowledge is stronger than opinions or emotions, and since better judgment represents this knowledge, no rational person should act against what he or she considers best. Often people nevertheless seem to act akratically. How can this phenomenon be explained?

As one crucial part of his explanation, Aristotle launches the practical syllogism, a calculative model of the emergence of human action. The

practical syllogism consists of a major premise that expresses a general principle and a minor premise that states a particular observation. Given the intellectualist framework, rational beings should follow the conclusion implied by the two premises. Aristotle’s famous example concerns eating: “Sweet things are to be avoided” (major); “this is sweet” (minor); and “this should be avoided” (conclusion). Hence, a person’s acts result from his or her calculative deliberations in terms of practical syllogism (EN 1145a-1147b).

The standard Aristotelian answer to the problem of *akrasia* is that akratic persons know the good in a universal sense, but their grasp of the minor premise is impeded or imperfect. Thus, the akratic person eats the sweets, knowing that sweet things should generally be avoided, but fooling himself or herself into ignoring the particular case at hand (EN 1147a-b). Is this ignorance voluntary or not? A great range of different answers has been presented. Thomas Aquinas, for instance, says that philosophically such behavior is like involuntary forgetting, but theologically it is voluntary (Saarinen 1994, 118–131).

In addition to Aristotle, there is a Stoic tradition of *akrasia* of which scholars have only recently become better aware (Müller 2009, 155–193). The Stoic tradition is fragmentary; we have some texts of Chrysippus and Galen and uncertain mentions from Plutarch, Epictetus and Origen. Augustine is in some ways connected to this tradition (Saarinen 2011, 19–27). The Stoic tradition survives in some examples, of which the two most popular ones are “the runner who cannot stop running” and the literary figure of Medea who falls in love and kills her children against her better judgment. Both Medea’s love and her rage are used as examples of *akrasia*.

The Stoics discuss two possible options of *akrasia*. First, there may be so-called pre-passions, akratic leanings that emerge before (sometimes only immediately before) a judgment is formed. Second, the agent may be so strongly predetermined by some earlier habits that the new information cannot change his or her course of action immediately but only after a delay. After the assented judgment, for instance, to stop running, the runner proceeds at least for some meters.

This proceeding might be called acting against one's own better judgment.

In Ovid's *Metamorphoses* 7, 20–21, Medea claims to “see the better and approve it, but follow the worse.” This means, according to the Stoic view, that she saw that it was better to stay at her father's home, but her love nevertheless caused her to continue with Jason. Although she intellectually decided to stay with her father, her earlier course of life was still so predominant that it led to a different action. In this manner, the case of Medea exemplifies the second Stoic option.

Plato's writings also play a role in the interpretation of akrasia. In *Protagoras* 351–358, Plato draws a picture of Socrates that is very similar to Aristotle's discussion in EN VII. This Socrates defends the view that “no one willingly goes to meet evil or what he thinks to be evil” (358c). In *Republic* 431, however, Plato outlines the inner conflict between the better and the worse parts of human soul, teaching that the better part, or reason, should rule the lower and irrational part. However, akrasia remains a genuine possibility, as there are situations in which the better part stays alive but is mastered by the lower one (Hoffmann 2008, 1–22). We may label the option of *Republic* as a/the “commonplace Platonic” view of akrasia, meaning a position in which reason and desire struggle in the human soul; desire can sometimes overcome reason. Augustine seems to have received some ideas from this tradition as well.

All three traditions – the Aristotelian, Stoic, and commonplace Platonic – are relevant for the understanding of weakness of will in the period between 1300 and 1650. The Aristotelian heritage dominates late medieval and early modern discussions. Stoic considerations and examples, Medea in particular, are increasingly mentioned in the sixteenth century. The commonplace Platonic picture of inner struggle is often mentioned in the treatment of akrasia; however, this picture is a general feature of the discussion rather than a distinct explanatory tradition.

The most important fourteenth-century discussion of akrasia takes place in John Buridan's commentary on EN. Buridan teaches that the will is prepared for action through three stages. The will first receives a judgment of the practical intellect,

informing it of various good and bad aspects of the alternatives under consideration. This preliminary judgment does not prompt action but only generates an act of “complacency” or “displacency” in the will. The cluster of first acts is followed by the second act of the will, which is the actual acceptance or refusal of the judgment's conclusion. The third act of the will is the action itself (Buridan 1968, 41–43).

Akratic conduct occurs in a situation that is characterized by a “twofold inclination”; that is, a situation in which a person inclines towards contrary alternatives. Incontinence is primarily located in the will, because it is the faculty of the soul that can exercise a choice towards one alternative or its opposite (Buridan 1968, 141). Although the different first acts of the will can exemplify different preliminary judgments, Buridan defends the final unity of judgment and assent. He therefore refutes the view that a person can, strictly speaking, have contrary judgments about a particular action.

Buridan is both Stoic and Aristotelian in his emphasis on the unity of the judgment. Although the first act of the will can generate different and contrary viewpoints, the complete situation will finally be judged in a unified manner. This is expressed in the second act of the will, which prompts action. The second act is not, however, a voluntarist manifestation of freedom, but an intellectualist affirmation of the best option. Buridan underlines this intellectualist stance in his decisive questions regarding weakness of will. In his view, since it is not possible to act against actual, particular, and perfect knowledge, akrasia is accompanied by some ignorance. He further holds that the will necessarily obeys the conclusion of the practical intellect, if this conclusion is argued with full clarity and certainty. On the other hand, Buridan concedes that concrete decision-making often takes place in uncertain situations in which weakness of will can occur (Saarinen 1994, 178–181).

Buridan's commentary had a vast manuscript diffusion (particularly in central Europe) and had several printings in the sixteenth and seventeenth centuries; it remained influential in the universities. Through Martin Luther's teacher

Bartholomaeus Arnoldi de Usingen, Buridan's views were familiar to the early Reformers. As Luther was critical of the scholastic treatment of "good works," Buridan's theory of action represented for him a typical scholastic view in which merit and virtue can be achieved through rational decision-making (Saarinen 2011, 105–132).

Among early-modern scholastic interpreters of weakness of will, John Mair (1470–1550) offers a thorough discussion that both continues Buridan's intellectualist leanings and is innovative in its strategy of preserving the idea of free will. He affirms the possibility of *akrasia* in three ways (Mair 1530, 110). First, Mair concludes that a person's will can prevent itself from working. This point resembles the Parisian condemnations of 1277 and John Buridan that ascribe to free will the option of remaining in the state of *non velle* (refusal to will something??) (Saarinen 1994, 168). The second way interprets Aristotle in a somewhat "commonplace Platonist" manner, claiming that the conflict between reason and desire features prominently in action theory and that desire can sometimes overcome reason.

The third way compares *akrasia* with so-called mixed actions, which are discussed in EN III, 1. A classical example of this kind is the shipping merchant who throws his goods overboard to survive a storm. For Mair, Aristotle's mixed actions recall features of *akrasia* although the person in Aristotle's examples does not ignore or forget anything. To make room for such affirmations of *akrasia*, Mair undertakes an original claim that in syllogistic deduction the *akratic* person can affirm something shameful while also thinking that nothing shameful should be followed. This is possible if the first case refers to some concrete choice at hand, whereas the second case pertains to what is morally right. In this manner, Mair can combine voluntarist conclusions with the overall syllogistic structure of Aristotelian action theory.

Petrarch's *Secretum* is an early example of the humanist reception of the problem of *akrasia*. In Petrarch, a person freely chooses the wrong option. While this fundamental choice is not caused by ignorance or disorder, it brings about ignorance and disorder as its consequence. These

problems of the incontinent person can be remedied in cognitive therapy so that the person can see his voluntarist nature in a truthful light. This picture is not very far from late medieval Franciscan voluntarism. When Petrarch's mask Francesco at the end of *Secretum* states that he cannot restrain his desire for study and turn to the spiritual road proposed by Augustine (Petrarch 1989, 144), he is not making a nonreligious free choice, but rather continues the tradition of late medieval voluntarism in an original way.

Much of fifteenth- and sixteenth-century humanist philosophy continues the doctrinal patterns of late medieval Aristotelianism. For this reason, the presentations of *akrasia* in Donato Acciaiuoli (1428–1478) and Jacques Lefèvre d'Étaples (1455–1536) are traditional (Acciaiuoli 1565, Lefèvre d'Étaples 1497). Some important innovations take place in Josse Clichtove's (1514) commentary, in which he provides the above-mentioned example of Medea's conflict as paradigm of *akrasia*. This example became extremely popular; it is discussed by most later commentators of the sixteenth and seventeenth centuries. As Medea exemplifies "clear-eyed *akrasia*," a situation in which one goes wrong knowingly and willingly, this example creates a counterweight to Aristotelian intellectualism. Different traditional interpretations of Paul's struggle in *Romans* 7 also appear in this context (for *Romans* 7, cf. Müller 2009 and Saarinen 2011).

Among later Catholic treatises, the moral philosophy of Francesco Piccolomini (1520–1604) discusses weakness of will in detail. Piccolomini wants to integrate Platonism more strongly with the existing traditions of Aristotelianism and Neo-Stoicism. He is aware of the intellectualist stance of *Protagoras*, but stresses also the "commonplace Platonist" view of inner struggle. He also analyses the case of Medea. One of his basic conclusions is that, while Plato focuses on the pure mind, Aristotle pays attention to the actual human condition. For this reason, Aristotle's views are to be preferred (Piccolomini 1595, 262–267). As a whole, however, Piccolomini's discussion remains eclectic and combines elements from different intellectualist

and voluntarist traditions. As a comprehensive textbook, his work had an extensive reception history in both Protestant and Catholic milieus.

In early modern Catholic thinking, the vocabulary of weakness of will is often replaced with other Aristotelian and scholastic discourses. For instance, while Francisco Suárez (1548–1617) discusses the influence of coercion, concupiscence, fear, and ignorance on voluntary action in great length, he does not treat these as instances of *akrasia* (Suárez 1856, 181–233).

The Protestant reception history of *akrasia* starts with Philip Melanchthon's scattered remarks. Melanchthon (1497–1560) is interested in the case of Medea and speaks frequently of the inner wrestling and struggles that last through a Christian's entire life (Saarinen 2011, 132–142). John Calvin (1509–1564) discusses *akrasia* explicitly in his influential *Institutio* (Calvin 2006, II, 2, 23). For Calvin, the conscience informs even sinful persons of their wrongdoing. At the same time, people can go wrong in their evaluation of particular facts so that they act against their better judgment. Calvin's view is fairly Aristotelian and has some resemblance to that of John Mair.

Melanchthon's pupil Joachim Camerarius (1500–1574) lays out a particularly detailed analysis of weakness of the will in his commentary on EN. Camerarius knows well the Platonic and Stoic traditions, but he adheres to Aristotelianism, which he attempts to harmonize with Melanchthon's theological and philosophical insights. He keeps the structure of the practical syllogism and argues, in keeping with the Aristotelian tradition, that the particular facts of the minor premise are not grasped properly in the akratic deliberation. Thus, some ignorance precedes akratic acts. Unlike former Aristotelians, however, Camerarius considers that the uncertainty related to our perception of empirical particulars is nothing less than "the cause of all evil" (Camerarius 1578, esp. 325–326).

The error of the akratic person thus concerns the particular circumstances: the devil is in the details. While this view is close to the Aristotelian syllogistic model, Camerarius is so focused on the uncertainty of particulars that his discussion

resembles that of Buridan. The neglect of the particulars is also voluntary. Camerarius advances significantly beyond Melanchthon and Calvin; he also departs from the earlier Aristotelian tradition. The weight of empirical particulars and the uneasiness provided by small changes is an innovation of Camerarius that we encounter later in Leibniz.

Among the early Calvinist authors on *akrasia*, Lambert Daneau (1535–1590) is particularly interesting for several reasons. He is often considered the first author who develops a Christian ethics, understanding ethics no longer as a philosophical but rather a theological discipline. Daneau is also the first author who applies Martin Luther's view of the Christian as "righteous and sinner at the same time" consistently to ethics. While Melanchthon and Calvin also borrow this idea from Luther, they do not work it out in detail and do not fully grasp its significance for the analysis of the human condition. The Reformation anthropology that has its origins in Luther receives its first fully elaborated moral-philosophical expression in Daneau's Christian ethics (Saarinen 2011, 188–200).

Daneau establishes the picture of inner wrestling as a core doctrine of ethics: Christian ethics is concerned with *virtus luctans*, the virtue that continuously wrestles with harmful affects. The results of this struggle manifest themselves as continence and, in case of failure, as *akrasia*. Daneau points out that no human being can achieve true virtue in this life because the power and tinder of sin remain active in us. Even the apostle Paul could not achieve perfect virtue, as *Romans 7* shows. *Romans 7* is an example of Paul's continence, not of his virtue nor of his weakness of will (Daneau 1583, 101). Daneau draws the conclusion that continence is the best stage that Christians can achieve in this life. It further means that a textbook on Christian ethics has to focus on the so-called wrestling virtue, as it is the option that we really encounter. Christians thus struggle between continence and weakness of will.

While the early modern period revives the old traditions of Aristotelianism, Stoicism, and Platonism, this period is also innovative in its treatment of *akrasia*. Buridan and Mair pay increased

attention to uncertainty and the voluntarist nature of human decision-making; this innovative current is continued by Camerarius. The Protestant authors claim that pure virtue is almost impossible in this life; at the same time, conscience points to the difference between right and wrong. For this reasons, Christians remain in the struggle between continence and akrasia. Daneau presents the universal version of such innovative claims in his view that Christian ethics as a whole is concerned with wrestling virtue.

The cultural and intellectual impact of these innovations is considerable. In practical philosophy, the new prominence of uncertainty and voluntarism means that moral considerations no longer appear as universal as they did in earlier Aristotelianism. The inner struggle exemplified by Medea and *Romans* 7 became a fashionable literary and theological paradigm in the early modern period. All humans were supposed to experience an inner struggle, and there are many different variants of such wrestling. Among the literary expressions of inner struggle, Shakespeare's *Sonnets* belong to the most famous.

The philosophical legacy of these themes is visible in the extensive contemporary literature concerning weakness of will. Not unlike Aristotle, contemporary philosophy often aims at explaining human action in terms of rational calculation. Phenomena like inner struggle and irrational behavior can be considered as philosophical challenges of such explanatory paradigms (Stroud 2014).

Wilson, Thomas

Born: August 1523 – January 1524

Died: 20 May 1581, London

Jonathan Woolfson

Sotheby's Institute of Art, London, UK

Abstract

Thomas Wilson was an English humanist, diplomat and administrator who rose to become an influential figure at the court of Queen Elizabeth I, culminating in his appointment as one of the queen's principal secretaries. He was educated in the Protestant environment of mid-century Cambridge, and both his humanist commitments and anti-Catholicism were sharpened by the experience of exile in Padua and torture and imprisonment in Rome. He is the author of a number of works which are significant for their success in disseminating ancient learning in the English vernacular in the fields of logic and rhetoric, including *The Arte of Rhetorique*, first published in 1554.

Biography

Thomas Wilson was an English humanist and administrator who rose to become an influential figure at the court of Queen Elizabeth I through powerful connections established during his education at Eton College and King's College, Cambridge. There he became a protagonist of the so-called Cambridge connection of Protestant humanists led by Sir John Cheke. His first positions were as tutor to the children of leading aristocrats, and in 1551 he published a manual on logic, *The Rule of Reason*, dedicated to King Edward VI (Wilson 1551). This was followed in 1554 by *The Arte of Rhetorique* (Wilson 1982). During the reign of Queen Mary I, Wilson, like many leading English protestants, went into exile and stayed in the city of Padua in north-east Italy with a circle of English friends. He proceeded from there to Rome, where he was denounced as a heretic, tortured, and imprisoned by the Inquisition. He only escaped when the prison was sacked and burnt down on the death of Pope Paul IV in 1559. Before returning to England, he acquired a doctorate in civil law from the University of Ferrara.

Back in England, Wilson pursued a career as a civil lawyer and member of parliament, but through the support of Sir William Cecil and Sir Robert Dudley, he also, in the 1560s, undertook duties for the privy council, including the examination of political prisoners, Catholics, and suspected traitors.

In the same period and into the 1570s, he acted as a diplomat for the English government in Spain, Portugal, and the Low Countries. This work earned him membership of the privy council from 1577, as well as his appointment as one of the queen's two principal secretaries. These major offices were assumed during a period when the queen was considering military intervention in the Low Countries against Spain, which Wilson, as an ardent anti-Catholic, earnestly supported.

Wilson's *The Rule of Reason* was the first logical treatise written in English and therefore represents an important moment in the vernacular domestication of the Latin liberal arts in England. It was reprinted seven times in the sixteenth century. *The Arte of Rhetorique* continued this

development and is a milestone in the Tudor and protestant humanist endeavor of transmitting ancient learning in the English vernacular, an ambition shared by many of Wilson's Cambridge contemporaries, and in a field – rhetoric – central to so much of Renaissance culture. Although this was not the first rhetorical manual to be printed in English, it was far more comprehensive than any of its predecessors, synthesizing the practical lessons of the major ancient and Renaissance rhetorical works and updating them with topical, humorous, patriotic, and protestant illustrations of rhetorical parts. It advances a linguistic agenda characteristic of Wilson's generation of English intellectuals, namely, to promote a pure vernacular English uncontaminated by foreign “inkhorn” terms.

The Arte of Rhetorique ran to eight editions in the sixteenth century, and Gabriel Harvey commented in 1570 that both this work and *The Rule of Reason* were “the dailie bread of owr common pleaders & discoursers” in the Inns of Court (Stern 1979).

Wilson continued the work of bringing ancient wisdom to a vernacular audience in his English translation of the Athenian rhetorician Demosthenes's *Orations* dating to 1570. However, this work also functioned as a scarcely veiled political allegory in support of an interventionist foreign policy against King Philip II of Spain, who is implicitly compared in this work to Demosthenes' foe, the expansionist King Philip II of Macedon.

Wilson's impact was significant as a popularizer and disseminator of ancient learning to an English-reading audience, particularly in the areas of logic and rhetoric.

Wimpfeling, Jakob

Born: Schlettstadt, Alsace, 25/07/1450

Died: Schlettstadt, Alsace, 17/11/1528

Dario Gurashi

Classe di Scienze Umane, Scuola Normale Superiore, Pisa, Italy

Abstract

Jakob Wimpfeling (1450–1528) was a prolific German humanist, historian, poet, and advocate of a renewal within the Catholic Church based on the reorganization of the education system. He denounced the wrongdoing inside the clergy and committed to educate young people through the reading of the classics. Because of the fame acquired, his advice was greatly considered by Emperor Maximilian I in affairs concerning diplomatic relations.

Biography

Jakob Wimpfeling (or Jacob Wimphenling) was a German theologian born in Schlettstadt,

nowadays Sélestat in France. Following the versatile attitude of humanist scholars, his written production concerns numerous areas of interests, ranging from literature to pedagogy and history, making him an illustrious exponent of humanism in Germany (Spitz 1963, 41–60). Specifically his works display fervid patriotism for German identity and resolute pedagogic vocation (Könneker 1987, 448).

After his father's death in 1463, his uncle Ulrich, parish priest in Sulz, took care of his upbringing and set Wimpfeling on the path of academic education and ecclesiastical career. He studied philosophy at the Freiburg University between 1464 and 1470, obtaining in 1466 the Bachelor of Arts. Forced to leave the city by the plague outbreak, Wimpfeling moved to Erfurt first (Knepper 1902, 3–13), then in 1469 to Heidelberg, where he focused to canon and theology and resided until 1483. In 1471 Wimpfeling was appointed *Magister artium* and ordained priest. At the time when he obtained the Licentiate of Theology, Wimpfeling was teaching at the Faculty of arts, of which he was appointed deacon at first, then vice-chancellor, and lastly dean (1481–1482; Geiger 1898, 525). Between 1483 and 1497, he became preacher in Spreyer Cathedral (Mertens 1993, 48) and subsequently taught rhetoric and poetry in Heidelberg until 1501, as requested by elector Palatine Philippe.

During these years, Wimpfeling entered the *Sodalitas Literaria Rhenana*, guided by Conrad Celtis since 1495 (Mertens 1993, 48–49), and, after some exercise in Latin poetry, was deeply committed to linguistic studies working on the *Elegantiarum medulla* (1493), an introduction to Latin composition, inspired by Lorenzo Valla (Könneker 1987, 448). The satirical comedy *Stylpho* (1495), written with Terentian features, increased his literary fame and introduced this genre in the coeval German literature (Mertens 1993, 46–47; Könneker 1987, 447). Furthermore he arranged his thoughts about the principles of youth education in the *Isidoneus Germanicus* (1496) – where he criticized the unproductiveness of the medieval scholastic system and claimed that pupils should draw directly from classics after a preparatory introduction to grammar – and in the *Adolescentia* (1500), which became a

manifesto in the field of humanistic pedagogy thanks to its Anti-Scholasticism (Geiger 1898, 533–534).

Pedagogical concern and theological commitment proceed hand in hand through Wimpfeling's life. While dealing with the reorganization of liturgical materials and promoting the improvement of clerical discipline, he demanded, in the *Oratio ad clerum Wormatiensem* (1477), that the Church played a crucial role in children's education in order to reform the Church itself. As Heidelberg Dean, he denounced, in the *Oratio de Sancto Spiritu* (1507), the abuses perpetrated within the Church because of clergy's avidity and stigmatized the moral corruption among young people.

In 1501 he forsook the tenure and left Sulz parish – where he succeeded after his uncle's death – for a moderate retirement and was welcomed to stay at Williamite Monastery in Strasbourg until 1515. During the first decade of the century, he published some historical treatises like *Germania* (1501), where he supported the German identity of Alsace (Mertens 1993, 50), and the *Epithoma rerum germanicarum* (1505), a handbook of German history (Geiger 1898, 532; Gotzen 2010, 1516–1517). Following the example of Celtis, in 1510 Wimpfeling created in Strasbourg, along with Sebastian Brant and Johann Geiler, a new *Sodalitas Literaria* that had the honor to host in 1514 Erasmus of Rotterdam among its guests. Hereafter Wimpfeling kept an enduring epistolary correspondence with the Dutch humanist.

In the same year, Emperor Maximilian I proposed him a project concerning the adoption in the Empire of a *pragmatica sanctio* (similar to the one issued in Bourges in 1438), the appointment of a perpetual papal legate for ecclesiastical affairs, and the suppression of German tributes to the Church of Rome. Wimpfeling advised against the first two points and pressed on the economic reform, treasuring the ideas developed in the *Gravamina* of the German nation (1457; Geiger 1898, 531; Könniker 1987, 448). From 1515 he lived permanently in Schlettstadt until his death. Although Wimpfeling initially sympathized with some of the reform ideas supported by the

Lutheran movement, he strongly opposed the Protestant Reformation after the public rupture between Luther and Pope Leo X (Könniker 1987, 449–450).

Witchcraft, Renaissance Idea of

Daniel Ortiz Pereira

Department of Philosophy and Humanities,
Comillas Pontifical University, Madrid, Spain

Abstract

There were two clearly differentiated ways in which the Renaissance understood the concept of witchcraft. The first one, originating from intellectual circles embedded in the Neoplatonic tradition, managed to either harmonize it with the categories which defined natural magic and other complementary occult disciplines or, on the contrary, consistently tried to disconnect it from established high-magic practices which, for these authors, had nothing to do with negromancy or demonic possessions. The second one emanates from the general debate that can be traced back to the Middle Ages concerning the nature and characteristics of witches. This conception leads to

the publication of Heinrich Kramer's *Malleus Maleficarum* (1487), whose contents, ultimately blended with contemporary social, political and theological issues, largely influenced the outbreak of constant witch trials across Europe during the mid-sixteenth and early seventeenth centuries.

Innovative and Original Aspects

Outside of significant practices dealing mostly with alchemical purposes, throughout the Middle Ages there was no distinction whatsoever between the concepts of witchcraft and magic. The established theory, which went back to Augustine of Hippo, who described magical activities as "criminal" (*Civ. Dei*, VIII, 18, 19, 26; IX, 1), considered any type of invocation of supernatural forces or phenomena as an act of rebellion toward God's omnipotence, something which could only be explained by means of an association between the magician and the devil (Levack 2006, 37–39).

This idea experienced, however, a noteworthy change during the course of the fifteenth century. The revival carried out by Marsilio Ficino's Florentine Academy of the *Hermetica* and of late-pagan Neoplatonic and neo-Pythagorean philosophers offered new insights on the practice of magic and theurgy. These contributed to the progressive delimitation of witchcraft as a vulgar and heretical activity opposite to the pious and noble practices of the Renaissance *magi* (Walker 2003, 30–54; Zambelli 2007, 35–43). As a consequence, Renaissance Neoplatonism distinguished two opposite types of magic: one which is, in Pico della Mirandola's own words (*Orat. de hom. Dig.*, § 37, 228), "execrable" and "monstrous" (*execranda et portentosa*), thus defining the nature of witchcraft and "black" magic, and another one which represents "the absolute perfection of natural philosophy" (*naturalis philosophiae absoluta consumatio*), which constitutes the basis of natural or "white" magic.

Despite this intellectual clarification, Renaissance demonology soon recovered the medieval spirit of establishing the social, political, and legal consequences of negromancy with the

publication in 1487 of Heinrich Kramer's *Malleus Maleficarum* – based on Nicolau Eymerich's 1376 *Directorium Inquisitorum* (Bailey 2003). The *Malleus* became one of the most renowned authorities in dealing, both theoretically and practically, with everything related to devil, witches, and Satanism. It gave rise to a number of treatises, such as Jean Bodin's *De la Démonomanie des sorciers* (1580), that, circulating throughout Europe in the late sixteenth-century, encouraged the outbreak of the first waves of witch-hunts. Nevertheless, there were still authors who remained skeptic with regard to the apparent devilish and demonic forces that characterized witches, to their initiation rites in the Sabbaths and, what is more relevant, to their influx on the human realm. The belief that the magical powers which were thought to be operating in witches by the action of evil spirits could be explained through natural phenomena and that their brutal and irrational manners could respond more to insanity or mental health issues than to hellish possessions, contributed to the emergence of another group of works, such as Johann Weyer's *De praestigiis daemonum* (1563), that aimed at moderating the punishment given to convicted witches – which normally involved torture and immediate death – claiming that they were unconscious receptacles of the devil.

In one way or another, there is enough evidence to verify the significant role that witch-hunts performed as instruments of political, social, and theological control (Clark 1999). In terms of the latter, the importance of preserving common beliefs within the boundaries of orthodoxy and of guaranteeing the moral effectiveness of persecutions led to the regular issue of public summonses in trials or executions and the wide dissemination of witch sermons pronounced by local preachers and other ecclesiastical authorities. Even more, these public *exempla* served as a method of overcoming potential political rebellions. There were many religious groups that, in the form of heretical and sinful movements inspired by the devil, were in fact organized structures that, in seeking power and control, made use of the popular credulity for their own aims (Levack 2006, 60, 65–67). It was not until the last quarter of the seventeenth century,

with the progressive decline of Renaissance occultism, that the concept of witchcraft, free from its philosophical, religious, and sociopolitical background, started to be approached from an eminently critical and historical perspective (Monter 1972; Henry 2008).

Women Writing in the Renaissance

Rossella Pescatori
UCLA, Humanities, Los Angeles, CA, USA
El Camino College, Humanities, Torrance,
CA, USA

Abstract

Since the sixteenth century, more women published their work despite the still existing

belief of their distinct gender inferiority to men. Women used to receive literacy and education according to their social class and wealth; however in the Renaissance a larger number of women could read and write their native language. The new printing industry was one of the factors that stimulated women to write and publish. It offered a new accessibility of knowledge and the opportunity to easily communicate with the external world. A larger number of translations from Latin into vernacular were available, and a new attitude toward culture promoted by humanism produced a change toward the involvement of women into culture. Many of these women writers are considered proto-feminist and were involved in a literary debate about the nature and status of women, known as the *querelle des femmes*.

Innovative and Original Aspects

Even though the society was men-centered, women writers began making important contributions to Renaissance culture starting the fifteenth century. Educated women were nuns, noblewomen, and courtesans, and many of them wrote poetry and prose. There are a few recorded writers of the fifteenth century; some of them are considered proto-feminist and are classified under the label *querelle des femmes*, “the woman question.”

Christine de Pisan (1364–1430) was born in Venice, but lived mostly of her life in France. She wrote in vernacular French *The Book of the City of Ladies* (around 1405) and *The Treasure of the City of Ladies* (after 1405). Isotta Nogarola (1418–1466), born in Verona, was one of the women humanists. She wrote in Latin several letters to the intellectuals of her time. She was a fine scholar and very knowledgeable of the works of Aristotle, Boethius, Aquinas, and Averroes. Her famous work is *De pari aut impari Evae atque Adae peccato* (*Dialogue on the equal or Unequal sin of Adam and Eve*), which was also printed a century later by Aldo Manuzio in 1563. Other notable women humanists were Cassandra Fedele from Venice (1465–1558), and Laura Cereta from Brescia (1469–1499).

Cassandra Fedele was an excellent Latinist. She was famous for her letters, orations, and a philosophical work, *De scientiarum ordine*, which is nowadays lost. Laura Cereta composed her *Epistolae Familiaris*; while she shows a deep knowledge of classical authors, and philosophers, she also provides egalitarian positions toward women's intellectual capabilities.

Starting the sixteenth century, there was an increase of the use of the vernacular for scientific/philosophical texts; this can be related to a broader woman's readership, and consequently there were more women who published their own works in vernacular.

In the sixteenth century in particular at the court, women had very important role, as the treatise of Galeazzo Flavio Capella (or Capra) *Della eccellenza et dignità delle donne (on excellence and dignity of women)* published in Rome in 1525 and then in Venice in 1526 and Baldassare Castiglione's *Book of the Courtier* (1528) document. Women were expected to be able to converse with political men, diplomats, and intellectuals and actively participate to the cultural life. Many women became noteworthy for their fame and publications.

Vittoria Colonna (1492–1547), marchioness of Pescara, was a poet and intellectual. She married in 1509 Francesco Ferrante D'Avalos, maquis of Pescara, who was one of the commanders of the imperial army of Charles V. Starting 1519 she lived in Ischia and participated in the intellectual and cultural life of the Neapolitan court. Her husband died after a battle in 1525 and after that she decided to devote herself to a spiritual life in Rome. She wanted to become a nun, but pope Clement VII opposed her decision. Because of that she went back to Ischia where she lived surrounded by many intellectuals of her time. She exchanged letters with Pietro Bembo and was admired by Ludovico Ariosto. She was deeply active in theoretical and theological issues for the reformation of the Church. She was actively involved in the thought of Juan de Valdes and later followed the friar Bernardino Ochino with his reformation plan. In 1540 Vittoria was involved in the new spiritual movement lead by Reginald Pole and actively participated to all the reformation debates in Viterbo and Rome.

She was an active intellectual and considered one of the most brilliant minds of her time. Unfortunately little remains of her writings. The only collection that was edited directly by her is contained in the manuscript Vat. Lat. 11539 and was donated by her to her dear friend Michelangelo Buonarroti in 1540/1541. No printed edition was ever evaluated by her. Her prose works are mostly in the form of letters. Vittoria Colonna's poetry and prose show her religious views, which are connected to many of the philosophers of her time. Despite Neoplatonism, also Aristotelian and Averroistic trends are present through the medium of Agostino Nifo (Tallini, 2011).

Contemporary of Vittoria was Laura Terracina (1519–c. 1577), a member of the Accademia degli Incogniti. She wrote moral lamentations and poems and published the *Discorso sopra il principio di tutti i canti d'Orlando furioso (Interpretation of the first cantos of Orlando furioso; 1549)*.

Tullia D'Aragona (1510–1556), who defined herself as an "honest courtesan," was a poet and a philosopher. She was born in Rome in 1510 to Giulia Campana, a courtesan known as Giulia Ferrarese, and her father was thought to be Cardinal Luigi D'Aragona, who was in blood lineage connections with Ferdinand I of Naples. Giulia Ferrarese married Costanzo Palmieri d'Aragona who provided for Tullia a strong classical education. She became a courtesan at age 18 and lived her life between Siena, Venice, Rome, Ferrara, and Florence. She was known to be a brilliant and beautiful woman, and many intellectuals participated in intense conversations at her salon first in Venice, then Rome, and Florence. Among them Sperone Speroni, who adopted her person as one of the two voices on his *Dialoghi D'Amore* (1542), Bernardo Tasso, Claudio Tolomei, Girolamo Fracastoro, Benedetto Varchi, and Francesco Maria Molza. These last two are the interlocutors in addition to herself in her *Dialogues on the Infinity of Love* (published in Venice in 1547). This work shapes a new philosophical perspective from a woman point of view about love and the practices of love. Tullia shows a deep knowledge of the contemporary intellectual philosophical trends,

with interesting considerations on Platonic, Neoplatonic, Aristotelian, and logical argumentations. Tullia also left to us love poems and *Il Meschino* (1560), the first epic poem written by a woman. Other courtesan writers were Veronica Franco (1546–1591) and Gaspara Stampa (c. 1523–1554) who made major contributions to Renaissance love poetry.

Chiara Matraini (1515–1605) from Lucca, Tuscany, is another example of woman writer, who wrote poetry and prose. Of particular interest is her *Dialoghi Spirituali* (*Spiritual Dialogues*) that is modeled on Boethius' example of *De Consolatione Philosophiae*.

More related to the *querelle des femmes*, also in relation to contemporary works such as Ludovico Domenichi's *La nobiltà delle donne* (*On the nobility of women*) Venezia, 1549, and to the translation (1549) into Tuscan vernacular by Alessandro Piccolomini of the work of the German physician and philosopher Heinrich Agrippa of Nettersheim (1486–1535) *Declamatio de nobilitate et praecellentia foeminei sexus* (*Declamation on the nobility and preeminence of the female sex*, 1529), there is the work of Moderata Fonte, whose real name was Modesta dal Pozzo (1555–1592), a Venetian noblewoman. She composed religious poems and musical dramas in verse and wrote *Il Merito Delle Donne* (*on the Merit of Women*) published after her death in 1600. It was a work dedicated to the importance of women in the society and on their possibility to act and change for the best of the society.

Lucrezia Marinella (1571–1653), whose father was a famous physician and natural philosopher, lived mostly in Venice and had the opportunity to study and express herself. She wrote poetry and prose, among them her *La nobiltà et l'eccellenza delle donne* (*the nobility and excellence of women*), published in 1601. Marinella wrote this work in response to Giuseppe Passi, *I donneschi difetti* (*The Defects of Women*), published in 1599 in Venice and Milan. Marinella tips over the Passi's misogynistic argumentations and offers a scientific-philosophical work that rebuts Passi's points that declassified women. Marinella analyzes the

ideological basis of the patriarchy criticizing in particular Aristotle's gender theories showing the contradiction of his argumentations and all the weak points. Her discourse focuses on the nature of the rational soul, how there is physiological conformation into the gender of the body. This provokes a different way to react to desire and address the will. Physiology is related to ethical issues, and ethical work is significant for philosophy and history of medicine. Arcangela Tarabotti (1604–1652) continues this type of writing with *La tirannia paterna* (*Paternal tyranny*) published after her death as *La semplicità ingannata* (*Innocence deceived*; 1654).

Sara Copia Sulam (1600?–1641) left to us important writing from a Jewish woman perspective, in particular *Manifesto di Sarra Copia Sulam hebrea Nel quale è da lei riprovata, e detestata l'opinione negante l'Immortalità dell'Anima, falsamente attribuitale da SIG. BALDASSARE BONIFACIO* (*The Manifesto of Sara Copia Sulam, a Jewish woman, in which she refutes and disavows the opinion denying immortality of the soul, falsely attributed to her by Signor Baldassare Bonifacio*), published in 1621, in which she defends herself from accusation showing a deep knowledge of philosophical and theological problems.

Other European women writers were in Spain Teresa d'Avila (1515–1582) with her mystical writings and in France Margaret of Navarre (1492–1549), sister to the king of France, with her *Heptaméron* (1558), a collection of stories, and Louise Labé (c. 1524–1566), who, as poet, prompted women to intellectually excel. In England women authors connected to the *querelle des femmes* are Jane Anger with her *Protection of Women* (1589), Rachel Speght (born c. 1597), and Constantia Munda.

In the Renaissance the women writers came from a variety of social class; this shows a broader cultural emancipation, which involves also lower classes. Despite their different backgrounds and personal life, all these women show a deep interest in contemporary scholarship and an involvement and active participation toward the intellectual life.

Wonders in the Renaissance

Lily Filson

Dipartimento di Filosofia delle Scienze

Formative, Ca' Foscari University of Venice, Venice, Italy

Abstract

"Wonder" can describe both an object as well as the emotion it elicits, and the Renaissance reaction to these stimuli demonstrates marked departure in the intellectual history of previous ages. This age was defined by an embrace and indeed appetite for the production and collection of such objects, grounded in psychological, sociological, and political constructs of the day. Wonder became less of a transgression in a realm of knowledge from which one was

believed to be excluded by divine *fiat* (as with the essentially medieval attitude towards the mysteries of nature and man's inclination to curiosity) and more a pursuit of learned European culture from the fourteenth and fifteenth centuries onwards. Objects which elicited this wonder, whether they were naturally formed (or deformed in many cases) or man-made displays of technology and virtuosity, enjoyed a new prestige and position at the court and dedicated collections, the celebrated *wunderkammern* and similar encyclopedic arrangements throughout the continent.

Synonyms

History of the marvelous; Marvels; Preternatural history; Thaumaturgy

Heritage and Rupture with the Tradition

The Latin *mirabilia* has been noted to blur sacred and secular objects of wonder from at least the twelfth or thirteenth century, yet theologians and philosophers maintained a formal boundary between the supernatural (miracles) and the preternatural (marvels) which shaped Renaissance and early-modern conceptions of what qualified as either a wonder or wonderful. The major criterion of objects so defined was its capacity to evoke the emotional experience we also call wonder in its audience. This feeling of wonder had been elevated in the spectrum of the human experience from Aristotle for its role as the gateway to contemplation of the divine and therefore the door to all philosophy. Wonder and mystery were at the center of mystery-cult worship which flourished through the early centuries of the Common Era, including those of the Neoplatonic philosophers which the Renaissance subsequently inherited. In many instances, heights of religious display were matched by some thaumaturgic display which rested upon a closely-guarded secret known only to priests and initiates. These secrets could be technological and/or

related to some aspect of natural philosophy, and in the ancient world, the miraculous and the wonderful mingled freely. It was only with the advent of Christianity and the need to distance "true" Christian miracles from wonders and tricks from their pagan counterparts that distinctions between the supernatural (the agency of god, angels, demons, and other non-human forces), the merely preternatural (forces not yet understood but presumed to be natural; the cosmic rays, the world-soul, or various conceptions of spirit/aether/quintessence fall into this latter category), or manipulations of the known natural world had to be made. Whereas thirteenth- and fourteenth-century philosophers agreed on the importance of supplying natural causes for preternatural effects, the resulting analyses were subject to wide-ranging variation, especially with the expansion of Latin materials with the influx of Arabic writings' new repertoire of causal mechanisms. There was considerable overlap (the "wonderful" moving mechanical cult statues of Alexandria and ancient Egypt anticipated Renaissance automata and this class of related wonders, yet the moving/"living" statues which one encounters in medieval Catholic worship were presented as miraculous); however, the constant factor underlying wonder-theory and its associated material associations and production was a restricted access to knowledge about the wonders' operating principle, from late antiquity through the Renaissance. The attitude about the accessibility and transmission of this secret knowledge is its own topic charted in scholarship.

The wonder thus generated among audiences to whom this secret was denied generated its own kind of powerful social currency in the Renaissance and reinforced hierarchies of superiority and dependence among rulers as patrons and their courtly and diplomatic audiences as awed subjects. To successfully project wonder was to be perceived to wield the mystic dimension sought after in constructions of power. A king who demonstrated a vast knowledge and control of nature, and especially of forces both known and occult, was engaged in a display that was calculated to bolster his legitimacy by elevating him away from the apparent limitations of mundane

experience. The passive experience of wonder, which is from the viewer's perspective, also underwent a reevaluation between the medieval and Renaissance period. What was once considered an unseemly reaction from both a theological (it encouraged the dreaded curiosity looked down upon in Augustinian tradition) as well as social standpoint (it acknowledged ignorance), wonder began to be experienced as its own form of pleasure. The relationship of this wonder to another emotion, curiosity, can be used to demarcate what we may term a medieval mindset from its evolution in the proceeding centuries. Curiosity came to be reevaluated and transformed into a virtue; by the late sixteenth century, wonders are celebrated and promoted in treatises whose authors are conscious of the appeal of wonders to the intellect and the imagination as well as to the senses.

Zabarella, Jacopo

Born: 5 September 1533, Padua

Died: 15 October 1589, Padua

Marco Sgarbi

Dept. of Philosophy a. Cultural Heritage,
Università Ca' Foscari Venezia, Venezia, Italy

Abstract

Jacopo Zabarella (1553–1589) is considered one of the most acute and brilliant logicians of all time. He made an important contribution to the interpretation of Aristotle and developed original ideas especially in the field of logic and epistemology, opening up the pathway of early modern science.

Biography

He was born in Padua on 5 September 1533, the eldest son of Giulio Zabarella. He was well-versed in Latin and Greek from childhood, as one of his letters to the praetor of Padua demonstrates. He studied at the University of Padua, where he graduated on 19 June 1553, supervised by Marco Antonio Genova (1491–1563), who was professor of natural philosophy. He studied logic with Bernardino Tomitano (1517–1576), Latin and Greek with Francesco Robortello (1516–1567), and mathematics with Pietro Catena (1501–1576).

On 13 January 1564 he was appointed to the first chair of logic, succeeding Tomitano. On 4 January 1569 he secured the second extraordinary chair of natural philosophy. There was likely a pause in his teaching from 1574 to 1576 on account of the severity of plague in Padua. On 26 March 1577 he acquired the first extraordinary chair of natural philosophy, and in 1578, he published his *Opera logica* in Venice, thus opening a large debate on the order and method of knowledge among his contemporaries – especially with Francesco Piccolomini (1520–1604) and Bernardino Petrella (1529–1595). In 1580 Zabarella published his *Tabulae logicae* and also founded the Accademia degli Stabili. In 1584, he came under attack in two directions: from Piccolomini in his *Universa philosophia de moribus*, and from Petrella in his *Logicarum disputationum libri VII*. The same year, Zabarella's reply to Piccolomini was his *De doctrinae ordine apologia*. In the meantime, on 6 September 1585, he became professor of the second ordinary chair of natural philosophy, and the following year he published his *De naturalis scientiae constitutione*. In 1584, Ascanio Persio (1554–1610), a student of Zabarella, had replied to Petrella's charges in his *Logicarum exercitationum libri II*, to which Petrella himself responded with his *Propugnatio*, Persio re-engaging again in 1587 with his *Defensiones criticorum et apologetici primi adversus Bernardini Petrellae logicam*. Zabarella died in Padua on 15 October 1589. Five years later, in 1594, Piccolomini countered the *Apologia* with

his *Comes politicus pro recta ordinis ratione propugnator*. During Zabarella's lifetime, the *Opera logica* went through at least three different editions (1578, 1586, 1587), and after his death there were eleven further editions (1591, 1594, 1597, 1599, 1600, 1602, 1603, 1604, 1608, 1617, 1623). The *Tabulae logicae* was published five times (1580, 1583, 1586, 1587, 1589) in the decade before his death, and subsequently became part of the *Opera logica*. The commentary to the *Analytica posteriora* was published in 1582 and 1587, and appeared thereafter in the *Opera logica*. The *Apologia de doctrinae ordine* was published twice in Zabarella's life – in 1584 and 1587 – and then a further four times (1594, 1595, 1599, 1604), before becoming part of the *Opera logica*. The *De rebus naturalibus libri triginta* was brought together after Zabarella's death, and went through ten editions (1590, 1591, 1594, 1597, 1601, 1604, 1606, 1607, 1617, 1654). The treatise *De naturalis scientiae constitutione*, which was a part of the *De rebus naturalibus*, went into a separate edition in 1586. The *Commentarii in tres libros De Anima* underwent four editions (1605, 1606, 1619, 1647). The *Commentarii in libros Physicorum* (I, II, VIII) was published in 1601 and 1602, with the *Commentarii in libros de Generatione et Corruptione, et Meteorologica* appearing in 1602. The year 1602 additionally saw the publication of the treatises *De Augmentatione* and *De Putrefactione illa, qua Vinum vertitur in Acetum*.

Heritage and Rupture with the Tradition

Zabarella is one of the main exponents of so-called Paduan Aristotelianism and has been considered one of the most faithful interpreters and commentators of Aristotle. His exegesis is grounded in the reappraisal of ancient Greek commentators like Simplicius, Alexander of Aphrodisias, and Themistius. Yet, Zabarella cannot be characterized a pedantic follower of Aristotelian doctrines and in his works he firmly distinguishes the role of the philosopher from that of commentator (Randal 1961; Poppi 1972; Risse 1983; Mikkeli 1992).

In his 1568 *Praelectio*, Zabarella points out the duties and limitations of the commentator. He views a commentator as someone “who transmits to others the knowledge received from another, not as his own, but as that he received from another” (Bibl. Ambrosiana, Ms. D 360 Inf., 1v; cf. Bouillon 2009, 461–72). The commentator simply teaches what he has passively learned from other philosophers and discovers no new knowledge. Thus, the commentator is also named interpreter, because in general interpretation is “knowledge transmitted as received from another as such.” The commentator is always inferior to the commented author because otherwise he would teach “his science rather than that of another” (Ms. D 360 Inf., 2v). The commentator must recognize his peculiar inferiority, and for this reason “interpretation involves a certain form of servitude, and the interpreter is a servant (*interpres servus est*)” (Ms. D 360 Inf., 2v). Zabarella is critical of this kind of attitude toward knowledge, maintaining that this kind of servitude “is in itself very undesirable” (Ms. D 360 Inf., 3r). The commentator cannot recognize the truth by himself and needs to appropriate knowledge from the best philosophers. However, no good is greater than to acquire knowledge by one's own effort (Ms. D 360 Inf., 3r). Someone who teaches his own knowledge is not a commentator but a real philosopher (Ms. D 360 Inf., 1v) and aspires to acquire truth. So, a real philosopher, dealing with Aristotle's writings, should make it clear that some of Aristotelian doctrines are erroneous (Ms. D 360 Inf., 4r) – or else he provides a great disservice to the advancement of knowledge. Yet in his 1585 *Praelectio*, instead, Zabarella writes that a real philosopher is one who investigates the causes of things, working in the first instance directly with sensation and reasoning, and not relying on the authority and words of others. His view is that this is Aristotle's most compelling thesis (Dal Pra 1966, 288). Zabarella criticizes those alleged philosophers holding ideas that are “incompatible with sensation and natural reason” (Dal Pra 1966, 288). He emphasizes the fundamental role that empirical observation plays in scientific cognition, and stresses how reason, and not Aristotle, is the ultimate foundation of science

(Schmitt 1983, 11). Aristotle “despised neither sensation nor reason, but harmonizing reason with sensation and sensation with reason, and relying on the most solid foundations derived from sensation, he sought to penetrate the secret nature of each thing” (Dal Pra 1966, 289). Zabarella states that one should imitate Aristotle, and he writes that someone is an “imitator of Aristotle and a true Peripatetic because he follows his rule instead of his words” (Dal Pra 1966, 289–90). The rule sets aside probable opinions or conjectures that do not lead to epistemic knowledge in order to focus on demonstrative arguments based on sensation. Thus Zabarella can state that “I will never be satisfied with Aristotle’s authority alone to establish something, but I will always rely upon reason; such a thing is truly both natural and philosophical for us, and I will also seem to imitate Aristotle in using reason, for in fact he seems never to have put forward a position without using reason” (Dal Pra 1966, 290). Equally, Zabarella rejects the slavish attachment of Aristotle’s commentator to the philosopher’s word. One should not disdain to contradict his opinions or the ideas, “*quando ratio cogerit*” (Dal Pra 1966, 290). For Zabarella, therefore, Aristotelian ideas are valid not because they are “Aristotelian,” but because after careful scrutiny by the court of reason they are proven to be true (Palmieri 2007).

Innovative and Original Aspects

Zabarella’s greatest contribution to the history of logic is his instrumental conception of logic and his theory of scientific method (Vasoli 2011). He reached the conclusion that logic is an instrument through an examination of the various disciplines, of their subjects and aims. He proceeded from the recognition of the existence of two kinds of things, those necessary and eternal and those contingent. Necessary and eternal things are not under the mind’s control and their causes must be sought beyond the human will. They are the subject of “contemplative disciplines,” that is, theoretical sciences which search for the causes of things (divine philosophy or metaphysics, natural

philosophy, and mathematics). Contingent things, by contrast, are under the mind’s control, will and activity, and form the subject of operative disciplines. These latter cannot be considered either science or wisdom, because both deal in different ways with necessary things, whereas operative disciplines like ethics and poetics deal rather with prudence and art. Zabarella’s aim is to show that logic is neither a contemplative nor an operative discipline. To demonstrate this, he makes a distinction between “first notions” (*primae notiones*) and “second notions” (*secundae notiones*). Logic deals only with “second notions,” which are also called mental concepts. The “first notions” are subject to investigation by the philosopher (i.e., the natural philosopher), and these are concepts that immediately designate real things independent of the power and activity of the mind. They are always concepts, not things, although they refer to and directly mirror things, and this means that the natural philosopher never deals directly with things, even if he describes how things are. The natural philosopher deals with concepts that directly characterize things and aims for explanatory strategies to explain them. The “second notions,” on the other hand, derive from “first notions.” They are products of the mind in the exercise of its cognitive faculties. The main difference between “first notions” and “second notions” is that “first notions” designate things as they are, while “second notions” concern things as they are known and conceived in the mind – that is, they describe reality as it is thought to be. Zabarella gives an example that comes from the *Analytica posteriora* II.19: if we know Socrates, Plato, and Callias through perception, the mind forms a common concept of “man,” which is the concept of the thing (*conceptus rei*), that is, a first notion. When we are aware that the concept of “man” is the concept of every individual with the characteristics belonging to the concept of “man,” the concept itself becomes a species, that is a second notion. Given that “second notions” are a product of the mind according to its own will, and therefore contingent, they cannot be the subject of science, because science deals only with necessary things. For this reason, logic cannot be a science, but Zabarella also denies that it is

an art. With an art, the result of an operation is distinct from the operator and it is often associated with matter, while logical operations are entirely immanent in the mind. Zabarella therefore defines logic as an instrumental discipline or habit – in particular, the habit concerning “second notions.” It teaches us how to order concepts in the mind and how to acquire new knowledge.

Having defined the nature of logic, Zabarella’s pivotal epistemological problem is to solve the question of how scientific knowledge is possible, starting with an examination of the cognitive powers of the mind. In *De tribus praecognitis* Zabarella deals with the conditions of the mind in acquiring scientific knowledge as put forward by Aristotle in *Posterior Analytics*. Zabarella states that the object of speculative science is twofold: the first – the material aspect – is the *res considerata*, while the second – the formal aspect – is the *modus considerandi*. In the Aristotelian framework science exclusively concerns necessary things, and since matter is always contingent and accidental, science is concerned only with the form – that is, the *modus considerandi* – which is a priori to the object of knowledge (*res considerata*) and makes it knowable, whatever it is. Scientific investigation, therefore, is an examination of the condition of possibility for cognition in relation to a possible object in general. The conditions of possibility for cognition are what Zabarella calls pre-cognitions (*praecognita*). Since the speculative science is preceded by pre-cognition, to investigate the condition of possibility for cognition with respect to an object amounts simply to investigating these pre-cognitions. But again, pre-cognition, on which the speculative science is based, cannot be accidental, otherwise scientific knowledge would ultimately be accidental too. Pre-cognition must be grounded in principles that are primary, true, and immediate – that is, in logical principles that make cognition possible. Investigating the condition of possibility for cognition in general means, therefore, investigating the first principles of the sciences.

There are various first principles that are not demonstrable but for the purpose of demonstration and they are acquired thorough the senses. Zabarella explains that the knowledge of

principles is acquired by means of induction beginning from sensible knowledge. Induction, however, should not be understood as a syllogism that demonstrates unknown things by means of prior knowledge, but as a process that notifies the transition of knowledge of one and the same thing from sensation to the intellect. Ultimately, induction is the process by which particulars are comprehended under the general concept, but properly speaking it does not create new knowledge beyond what the mind has already acquired through sensation.

Sensible knowledge is the foundation for science, but it is not science itself. Indeed, sensible knowledge must first become intellectual knowledge to form then the basis of science, and this is made possible only by the passage of the sensible object – at first as images and then as an intelligible object – through a process of intellection. The transition from sensible to intelligible object is guaranteed both by the continuity of the process of knowledge and also by the subordination of the faculties of the mind. In other words, what is apprehended by sensation, the lowest faculty of knowledge – that is, the singular object – is apprehended also by imagination, a higher faculty of knowledge. The difference between sensation and imagination is that the former always works in the presence of the object, while the latter works in its absence. In turn, what is apprehended by imagination is also apprehended by the highest faculty, the intellect. Therefore, the sensible object is contained through its image in the intelligible object, and the intellect can thereby know the singular concrete object. The difference between sensation, imagination, and intellect lies in the fact that the latter acquires universal knowledge, from which the other two faculties are precluded.

Zabarella’s method is grounded on sensation, which provides all knowledge to the intellect, which means that method is the process of discovery through sensation what is most knowable by nature, namely the causes of things and universal concepts. In order to make his conception clear, Zabarella distinguishes the real method of learning from the order of learning. Such a distinction is fundamental to the difference between Zabarella and his follower’s conception of

method, and that of Platonic scholars and Ramists. Zabarella states that method is a logical instrument leading to the discovery of something unknown, while order is not an inferential process, but simply an arrangement of knowledge. In other words, order is not method: the former “arranges,” while the latter “notifies” or provides knowledge. Method discovers new knowledge; order does not. In starting with what is more knowable to us – that is, sensible knowledge – Zabarella rejects the common assumption of humanistic logic that it is always necessary to start from what is primary in nature. Zabarella is clearly distinguishing an ontological order from an epistemological order. His science rests on logic and epistemology, whose interest is limited to explaining the things that appear to the senses.

Method for Zabarella can be either resolute (analytic) or compositive (synthetic or demonstrative). The analytic method proceeds from effects to causes, while the synthetic proceeds from first causes to effects. The synthetic method is superior to the analytic because its demonstrative power is superior, starting from the knowledge of causes; indeed, the analytic method “serves” the synthetic method. In particular, the synthetic method is superior because its end is not simply the discovery of first principles, but the knowledge of things, that is, effects, by means of causes. Furthermore, Zabarella adds, if the principles were already known, the analytic method would be useless.

Zabarella’s entire logical system, however, is grounded on the analytic method. He posits two kinds of analytic method: (1) demonstrative induction, and (2) demonstration from effects (*ab effectu*). The analytic method is the necessary but not sufficient condition for acquiring scientific knowledge, most of all because it provides a confused knowledge of a thing’s existence. The synthetic method, conversely, demonstrates the cause or essence of the thing and for this reason it is called demonstration *propter quid*. Unlike other logicians, Zabarella argues for an identification of demonstration *propter quid* with *demonstratio potissima*. The latter was usually considered the best kind of demonstration because it gave reasons for both the existence and the cause of a thing, while the former did so only for the cause.

However, according to Zabarella, cause cannot be properly demonstrated without existence, and so demonstration *propter quid* cannot be otherwise than *demonstratio potissima*.

Scientific knowledge can be acquired only in the conjunction of the analytic and synthetic methods, and in this conjunction lies the entire theory of the regress (*regressus*). Regress leads the initial confused knowledge to a final, distinct, and perfect knowledge. Take the demonstration *ab effectu*:

where there is generation, there is matter,
in a natural body there is generation,
therefore in a natural body there is matter

The major premise (“where there is generation. . .”) is discovered by induction and therefore provides only confused knowledge; the minor premise (“in a natural body. . .”) comes from observation, so the conclusion can only be known in a confused way. What the demonstration *ab effectu* proves is not the cause itself, but simply that there must be a cause of the effects, and perhaps the one we have obscurely recognized. This is the first part of the *regressus*.

In order to acquire knowledge of the effect by means of a distinct knowledge of the cause, and to demonstrate that the cause discovered by the analytic method is that correctly pertaining to the effect, Zabarella requires a “mental examination.” Mental examination, or consideration, is constituted by two moments. The first recognizes the *existence* of the effect’s cause and prepares for the discovery of that cause’s essence or nature, while the second compares the cause (known only confusedly) with the effect. If the comparison is successful, we can say that the causes and principles discovered initially in a confused way are the genuine causes and principles of the effects, now known perfectly. This is the final moment of the *regressus* and it coincides with the *demonstratio potissima* – that is, with the acquisition of scientific knowledge (Berti 2009; Mikkeli 2010).

Impact and Legacy

Zabarella’s philosophy had a profound impact on the development of logic in the seventeenth

century, especially in Britain and Germany. As regards direct influence, in the seventeenth century the British Isles saw his works adopted by the universities of Cambridge, Oxford, Glasgow, St. Andrews, Aberdeen, Edinburgh, and Dublin. British logical textbooks such as those of John Argall (1605) and Richard Crakanthorpe (1622), which were far more detailed and advanced than Ramist textbooks, were largely inspired by Zabarella. Griffin Powell's *Analysis analyticorum posteriorum sive librorum Aristotelis de demonstratione* (1594) and John Flavel's *Tractatus de demonstratione methodicus et polemicus* (1619) clearly evince Zabarella's legacy. Respecting the nature of logic and syllogistic, Zabarella plays a major role in Robert Sanderson's *Logicae artis compendium* (1615), which had a direct influence on John Locke and Isaac Newton. Zabarella's impact on British seventeenth-century logic was additionally mediated by French textbooks such as Philippe Du Trieu's *Manuductio ad logicam* (1614), and by the publication in Britain of Giulio Pace's *Institutiones logicae* (1597) and *Logicae rudimenta* (1612), which were commonly used for logic classes. A special role was reserved for syncretist Bartholomaeus Keckermann, who in his *Gymnasium Logicum* (1606) mixed Ramist elements with Zabarellean doctrines. Zabarella's logic equally enjoyed widespread success in the German territories. Authors such as Clemens Timpler, Bartholomäus Keckermann, Johann Heinrich Alsted, Georg Gutke, and Abraham Calov show his influence. The early reception of Zabarella's *Liber de tribus praecognitis* is particularly clear in Alsted's four books of the *Philosophia digne restituta* (1612). In the second book, devoted to the foundation of the science of the intellectual habits – that is *Hexiologia* – he clearly draws on Zabarella's ideas. Zabarella contributed to the rise of facultative logic in Protestant countries, especially in the genesis of the disciplines of gnostology and noology. The first important work is Georg Gutke's *Habitus primorum principiorum seu Intelligentia* (1625), which is re-elaboration of Zabarellean logic. Calov exploits Zabarella's logic and considers gnostology an instrumental discipline which has

to do with the habit of the mind knowing an object perfectly, while noology is the science of the mental habit from the use of which the mind acquires the first principles of knowledge (*principia cognoscendi*) of demonstration. Calov's philosophical elaborations made Zabarella's thought pivotal in the history of the philosophy of mind, exerting a powerful influence on Gottfried Wilhelm Leibniz, the German Enlightenment, and critical philosophy (Sgarbi 2012, 2017, 2018).

Abstract

Marco Antonio Zimara was born in San Pietro in Galatina in around 1470 and died sometime after 1529, the last year for which we have certain information regarding his life. He completed his studies in Padua, receiving a doctorate *in artibus* in 1501 and obtaining a degree in medicine. Marcantonio's fame is linked in particular to the compilation of his *Tabula*, but he was also a prominent figure in the world of Renaissance publishing. This can be seen, for example, in the wide circulation of his works throughout Europe for most of the seventeenth century and his efforts as an editor of the works of Aristotle and his medieval interpreters, as

well as in his attempts to resolve the most debated contradictions between the teaching of Aristotle and that of Averroes. This endeavor gave rise to the *Theoremata* and the *Solutiones contradictionum* and can clearly be discerned in all his work, including his surviving manuscripts. Following Aristotle, he reaffirms the superiority of *diffinitio* over *demonstratio* and, within the latter, the priority of *demonstratio propter quid* over *demonstratio quia*. However, he recognizes that the complexity of nature eludes the absoluteness of logical reconstruction, which is more suited to metaphysics.

Biography

Marco Antonio Zimara was born in San Pietro in Galatina in around 1470 and died sometime after 1529, the last year for which we have certain information regarding his life. He completed his studies in Padua, receiving a doctorate *in artibus* in 1501 and obtaining a degree in medicine. His teachers at the *Studium* of Padua included the Scotists Antonio Trombetta and Maurizio Ibernico, the Averroist Nicoletto Vernia, and Pietro Pomponazzi. In 1507, in Padua, he was appointed to the extraordinary chair of philosophy, and later, in 1525, to the chair of ordinary philosophy *in primo loco*. Between his first and second teaching periods in Padua, he continued with his didactic activities, moving first to Salerno (1520) and then to Naples (1523), and he also became involved in the political life of his native town, where he held the office of mayor in 1514 (Antonaci 1970; Paladini 2001; Rugge 2004).

Heritage and Rupture with the Tradition

Zimara's commentaries on the Aristotelian *corpus* and on editions of Aristotle by medieval interpreters are important for understanding his relationship with the preceding philosophical tradition. In addition to Aristotle, Marcantonio also commented on and republished the works of Themistius, John of Jandun, and Albert the Great.

Zimara's interest in the works of Aristotle went hand in hand with his teaching activities. Close examination of the chronology of Zimara's editions of Aristotle reveals that the focus of his interests was related to the centers of study in which he was lecturing. Thus, in the early sixteenth century, during his first teaching period in Padua, he was concerned with publishing logical and metaphysical works, without neglecting the more important commentaries, such as those of John of Jandun and Albertus Magnus. In Salerno, however, already towards 1520, he gave greater importance to Aristotelian physics and medical questions, which were gaining ground in that center, traditionally more inclined toward problems of medical science, due to the diffusion of the apocryphal *Problemata*. His time in Naples and the second period in Padua, however, were taken up with more specialized works, which reflect his mature thought (Antonaci 1970; Garin 1973; Papuli 1991; Spruit 1995).

Innovative and Original Aspects

Marcantonio's fame is linked in particular to the compilation of his *Tabula*, but he was also a prominent figure in the world of Renaissance publishing. This can be seen, for example, in the wide circulation of his works throughout Europe for most of the seventeenth century and his efforts as an editor of the works of Aristotle and his medieval interpreters, as well as in his attempts to resolve the most debated contradictions between the teaching of Aristotle and that of Averroes. This endeavor gave rise to the *Theoremata* and the *Solutiones contradictionum* and can clearly be discerned in all his work, including his surviving manuscripts (Antonaci 1970; Rugge 2004).

Zimara's *Tabula* was published posthumously, with the first edition dating to 1537. The encyclopedic nature and organization of the work, which was one of the earliest and most successful examples of a dictionary of philosophical terms, made it extremely useful in Italian and foreign centers of study. An examination of the various editions, which were also gradually improved in terms of

their layout and the prominence given to the most important entries, allows the development of particular topics and the new features they assumed to be traced, particularly with regard to physics (the concepts of motion, time, and space) and medicine (the circulation of the blood, the function of the liver, and the anatomy of the heart and the arteries), which now attracts the attention of teachers and students in the Faculty of Arts.

The *Tabula* would be sufficient, in itself, to provide an overview of the history of thought in the period spanning the fifteenth and sixteenth centuries. Marcantonio had a particular propensity for synthesis, which was the result of his careful examination of the questions.

The *Theoremata* was also a fundamental work with a broad scope, and was as widely read as the *Tabula*. Its topics range from logic, physics, and metaphysics to medicine. The latter is given much importance because, although the *Theoremata* was completed and published for the first time in Naples in 1523, when Marcantonio Zimara was teaching metaphysics at the University of San Lorenzo, it was greatly influenced by his time in Salerno and the speculative interests of the Studio there, where he had not only taught philosophy but also theoretical medicine during the previous years. Zimara remained in Salerno for a number of years (probably from 1518 to 1522) and left a lasting impression there. Many additions were made to the subsequent editions of the work (from 1539 onwards), particularly by his son Teofilo, without, however, deviating from the genuine text and thought of the *Teoremata*.

Yet another, equally significant work by Zimara was his *Solutiones contradictionum*. The original version of this dates back to Zimara's first teaching period in Padua, in around the first decade of the sixteenth century. It reflects the richly polemical and often tumultuous environment that stimulated the minds of the pupils and teachers, both in and out of school, centered on one essential issue: the correct interpretation of Aristotle by Averroes.

Zimara took a stand against the Arab philosopher's detractors. Nevertheless, as he himself stated, his intention was not an indiscriminate and preconceived acquittal of Averroes, but a

careful examination of the text and the commentary, which was not to be forced or led toward interpretations that reflected neither Aristotelian nor Averroistic thought.

The detractors of Zimara's position included his teacher, and then bitter rival, Pomponazzi, who used his authority and prestige to hamper his assignment to the ordinary chair of philosophy for a long time, as is well known (Nardi 1958; Bianchi-Randi 1982; Bianchi 2003).

Impact and Legacy

In both *Solutiones contraddictionum* and the *Tabula*, as well as in the *Theoremata*, Zimara admits the possibility of regressive demonstration in *scientia*. Following Aristotle, he reaffirms the superiority of *diffinitio* over *demonstratio* and, within the latter, the priority of *demonstratio propter quid* over *demonstratio quia*. However, he recognizes that the complexity of nature eludes the absoluteness of logical reconstruction, which is more suited to metaphysics. The cognitive subject emerges as central to Zimara's thought, safeguarded by logical procedures that are indispensable for scientific progress, due to their discursive and argumentative nature. Logic, as can be clearly seen from a reading of his *Annotationes* to John of Jandun's *Metafisica*, has a formal and instrumental nature and is strictly distinct from metaphysics. Logical rigor is in fact the means by which the subject involved in study gains awareness of his centrality in the cognitive process. Some interpreters have recently highlighted this centrality of the cognitive subject as his most interesting contribution to the philosophical debate of the fifteenth and sixteenth century, making Zimara a figure of unquestionable importance in both the teaching of Padua and in Renaissance publishing (Mahoney 1971; Verardi 2012; De Carli 2013).

Zodiac, Renaissance

Matteo Cosci

Università Ca' Foscari Venezia, Venice, Italy

Abstract

The zodiac is a celestial coordinate system, both with conventional astronomical purposes and with symbolic, astrological meanings. From ancient times to the present day, the zodiac is intended as a sort of circular belt on the starry vault that is transversally situated in respect of the solar ecliptic (namely, the apparent path of the Sun on the celestial sphere, along its annual turn), marking the zone where the relative movements of the Moon and the solar system planets usually take place. Because of Earth's rotation, the constellations in this area always appeared to be in circular motion: hence it came its ancient name of ζῳδιακός (*zōdiakós*), a compound of *zōon*, “animal,” or “living being,” and *hodòs*, “path.” In fact, the “proceeding” stars within the zodiac have been grouped into 12 consequent constellations called *signs*, according to a 12-fold classification that also and especially in Renaissance was maintained as based on the imaginative appearances of mythological beings in the skies and their respective astrological/astronomical significance.

Impact and Legacy

A formal definition of what was the zodiac in Renaissance times can be found in Knittel's *Cosmographia elementaris* (1647), where the scholar wrote: “Zodiacus est circulus maximus, cuius poli distant a polis Mundi gradibus 23½.

Secat Aequatorem oblique, ita ut super aequatorem sit inclinatus, et una zodiaci medietas vergat ad Septentrionem, altera ad Austrum. Punctum vero medium utriusque; Medietatis ab Aequatore recedit gradibus 23½. Secat illius latitudinem per medium una linea, quae dicitur Ecliptica, quia in ipsa, aut prope ipsam fiunt Eclipses. Caeterum continet intra suam amplitudinem 12 constellationes, quae libet continet 30 gradus. Earum autem nomina sunt: ♈ Aries; ♉ Taurus; ♊ Gemini; ♋ Cancer; ♌ Leo; ♍ Virgo; ♎ Libra; ♏ Scorpius; ♐ Arcinens [Sagittarius]; ♑ Caper; ♒ Amphora; ♓ Pisces.” He made clear that the practical functions of the zodiac for astronomy were many: it divides the heavens in their austral and boreal parts; it is the region where eclipses take place; it allows to measure the proper motion of planets and calculate the longitude of the fixed stars; it is the cause of night/day inequality and of the seasonal alternance along the year. Finally, he reminded that the zodiac has four main points: two of them are equinoctial, where the zodiac intersects the equator, and two of them are solstitial, which are at the maximal distance from the equator.

Nonetheless such an astronomical definition of the zodiac was somehow a point of arrival, since the main role that it had for centuries, or rather for millennia, was peculiarly astrological. Planets and zodiac stars were regarded as influential or even responsible for almost all the earthly events, human matters included, and even on individual level. The planetary configuration in the zodiac as it appeared at the time of the birth was considered to have effect on the genesis of inner predispositions, inclinations and behavioral attitudes, formation of humors and temperaments, anatomical structure, and even physical aspect. Consequently, during Renaissance times, the astrological importance of such celestial coordinate system was a decisive element for horoscopes and nativities, as well as for predictions and any sort of important decision-making, since “according to the relation of the planets among themselves to the signs of the zodiac, future events and the course of whole lives were divined and the most weighty decisions arrived at” (Burckhardt 1860).

The zodiac subject *as such* was never felt as a heretical field of knowledge, and it was easy to maintain an astrological faith in the stars together with a religious devotion to God (as attested, e.g., by the emblematic case of Agostino Chigi and the frescos that he commissioned, where both the elements are present).

The view of Marsilio Ficino was also hybrid and somehow ambiguous, because on the one hand he condemned the astrological use of the zodiac in his *Disputatio contra iudicium astrologorum* (1477) and on the other hand he defended its normative utility for the medical field in his *De vita* (1489); and in his *De Rationibus musicae* (1484), he set the zodiac signs in relation with musical notes, where the positive or the negative aspect of the signs matched, respectively, with harmonic consonances and dissonances (Kristeller 1937; Garin 1976).

Campanella thought that zodiac signs were the expression of minor “dignities,” the last supernatural powers of the celestial hierarchy, whose influence was very hard to decipher for the sky observer. According to him, it was essential to know the “ascendant” of the event that was under interpretation, even if getting the right ascendant was almost impossible and always correctable. Interestingly, he observed that adopting the geocentric or the heliocentric astronomical model was non-influential for astrology, since it was interested just in the *relative* positions of the sun, planets, and zodiac stars *from the earthly point of view* (Tester 1987).

However there was no shortage of attacks against the zodiac and the astrological doctrines that it was accompanied with. Savonarola’s *Tractato contra li astrologi* (1497) and Pico’s posthumous *Disputationes adversus astrologiam divinatricem* (1496) represented two of the strongest threats against the astrological zodiac and its mundane understanding. Pico, in particular, criticized the arbitrary division of zodiac sectors in the heavens (“where the stars are turned into animals and the sky is full of fairy tales”), as artificial, questionable, and disagreeable, also because of the phenomenon called “precession of the equinoxes,” that the astronomers of his time wrongly did not take account of.

According to A. Kircher’s *Ars Magna Lucis et Umbrae* (1646; 1671), zodiac is the place where the blessed and the saints found their afterlife rest, and its 12 signs correspond to the 12 emanations of divine virtues. Among many others, he held to the ancient Hermetic doctrine that the human being, as a microcosm, reflected the macrocosm so that every part of the body was dependent on a sign of the zodiac, from Aries at the head to Pisces at the feet (a doctrine known as *melothesia*). In fact, as Stegman wrote: “in the Renaissance. . .the Zodiac [as symbolic set] provides an explanation of the celestial system as well as of temperaments and humors from which even pure scientists, who ignored or condemned legal astrology, deducted psychological correspondances and clinical diagnosis. It was, in fact, also through the symbolic sciences that natural sciences, physical and psychosomatic medicine progressed” (Stegman 1972, 10–11).

The Jesuit Jeremias Drexel wrote a popular *Zodiacus Christianus* (1618; 1622), where he tried to christianize the 12-fold pattern of the zodiac into a new one, with moral intent. Also William Lilly’s *Christian Astrology* (1647) was an attempt of making use of the zodiac for Christian purposes.

In his *De Stella nova* (1606), Kepler argued that the 12-fold division of the zodiac is just a historical, made-up device and so also the nomenclature of the signs is anything but the result of human imagination, so without any natural significance (Field 1984, 201). On the other hand, the astrologer J.-B. Morin still maintained that zodiac’s celestial sectors (or “houses” of the signs) are not arbitrary nor conventional divisions but rather that they are real marks always present in the nature of the heavens, as he wrote in the seventeenth book of his posthumous work *Astrologia Gallica* (1661).

Both Islamic and Jewish cultures were also very acquainted with the astrological and iconographic power of the zodiac. The zodiac pattern emerged as a decorative theme in Jewish art, from synagogal mosaics to frontispieces of Hebrew manuscripts, with concealed meaning of messianic expectation (Sonne 1953). The Arab Middle East made a precise and stylized use of the zodiac

on detailed stellar maps, although there it was deprived of almost all its mythological background (Saxl 1985 [1925–1926]).

In Renaissance times, the zodiac set of constellations was a widespread iconographic motive and favored symbol of adornment, both in private and in public sphere, making its appearance even on tapestries, miniatures of codices, tarots, and playing cards (Zuffi-Novellone 2009). Along the time, it appeared on stellar circular maps, as on the famous Dürer's engravings, and on celestial globes of the starry vault, with decorative and didactic purposes (Bodnár 2007).

It had also a recognizable civic and urban character, as it appeared in courthouses and on many tower clocks of some European central squares, but it was on the walls of noble halls that zodiac imaginary dominated the scene. In fact magnificent representations of the zodiac can be found not only on the ceilings of many court palaces of the main royal houses but even in shrines and chapels in the Vatican, with astrological and heraldic valences.

The mythological images of the zodiac struggled for a long time to be always updated in consideration of the new astral discoveries, trying to maintain their long-standing role among the sciences, until the roads of astronomy and astrology started to tear irremediably apart.

Zorzi, Francesco

Born: Venice 1466

Died: Asolo 1540

Pasquale Terracciano

Civiltà e Forme del Sapere, Università di Pisa,
Pisa, Italy

Abstract

The Franciscan friar Francesco Zorzi was one of the leading figures of the Christian Kabbalism. Inspired by the writings of Marsilio Ficino and Giovanni Pico della Mirandola, Zorzi in his *De Harmonia Mundi* and in his *In Sacram Scripturam Problemata* built a theological system whose aim is the concordance of the universal wisdom. His personal mystical chrystology and eschatology – which will drive in the ultimate and ineffable restoration in the Supreme Good – are led by constant calculations on musical theory. The study of the musical tones, indeed, allows to understand the intimate structure of the universe.

Zorzi was fundamental in creating a sort of philosophical encyclopedia on Platonism, Pythagoreanism, and Kabbalism, destined to be influential in the sixteenth and seventeenth century. His books will have a long censorial history, started before of the creation of the Sacred Congregation of the Index.

Biography

Francesco Zorzi was born in an influential aristocratic family of Venice in April 1466. He had an ecclesiastic career in the Franciscan Order, during which he was *delegato apostolico* for the Jubilee of 1500 and provincial superior (*Vicario provinciale*) for Venice in 1513–1515 and in 1522–1525 (as *Ministro provinciale*). Zorzi was preacher in the St. Mark's Basilica and multiple times candidate for the Patriarchate of Venice. At the same time, he took part to the Venetian civil life, holding relevant diplomatic assignments (Berengo Morte 1946). In 1530–1531 Zorzi collaborated with Henry VIII's emissary, Richard Croke, in order to collect favorable responses, among Christian and Jewish theologians, for the case of divorce of the King (Vasoli 1974; Campanini 2010). Zorzi was indeed one of the leading figures of the Christian Kabbalism to the point that Francis Yates called him "the Cabalistic Friar of Venice" (Yates 1979, p. 29).

He taught biblical studies and Hebrew language in the convent of San Francesco della Vigna in Venice. In 1533 he was appointed to supervise, as "procuratore della fabbrica," the reconstruction of the Church, committed to the architect Jacopo Sansovino. Zorzi developed a *memorandum* of Platonic and Kabbalistic numerology, based on the power on the number three (because of its association with the Trinity) which was the Sansovino's guide for the project (Wittkower 1962; Vicentini 1954; Foscari and Tafuri 1983).

Master of Kabbalistic studies, innovator in musical theory, eminent Platonic theologian, Zorzi spent last years of his life in convent in Asolo where he died in 1540.

Works

Zorzi's principal works has been defined by an attentive scholar of the Italian heresy, Antonio Rotondò, as the most disturbing books of the sixteenth century (Rotondò 1973, p. 1428). His masterpiece was *De Harmonia Mundi totius cantica tria*, published in Venice (1525). It is a poem in prose, which aims to the concordance of the universal wisdom; be able, for a side, to traduce the cosmic harmony in an architectonical and musical structure; for another side, to trace a mystical ascension which enlightens the principle of the coincidence of the beginning with the end of the universe. The book is divided in three *cantiche* (respectively, on God, Christ, Man) each consisting of eight tones. At the end of the book, 20 mystical hymns describe the beauty, the quiet, and the perfection of the celestial realm. The *In Sacram Scripturam Problemata* (Zorzi 1536) is a collection of interpretations of biblical passages to the light of the *prisca theologia*, with the intention to satisfy the new spiritual (and political) issues arising from the deep religious crisis in Europe. Zorzi (1991) furthermore wrote a philosophical poem in vernacular Italian, the *Elegante Poema*, inspired to Dante's *Divine Comedy* (Scapparone 1990) and a *Commentary* on the Kabbalistic *Conclusiones* of Giovanni Pico della Mirandola, which will have subterranean circulation in the Franciscan Order (Wirszubski 1974; Campanini 2010, p. XXIII).

Despite their difference in structure and finality, the works present a common view. The richness of the Zorzi's knowledge of the Hebrew sources is integrated into a coherent Neoplatonist system, melted with Pythagoric and Vitruvian fascinations: musical analogies and Platonic theory of the proportions offer the framework for the description of the universe. In Zorzi's doctrine, the Platonism and Hermeticism of the late Florentine Quattrocento – and their prominent anti-Averroism – are matched with contemporary apocalyptic anxieties. Furthermore, alchemical suggestion and Origenistic proposals found a synthesis which has the Kabbalism as *leitmotiv*. The explosive combination is filtered in a personal mystical chrystology and eschatology which will

drive in the ultimate and ineffable restoration in the Supreme Good (Busi 1997; Campanini 2007).

Doctrines

At the center of the Zorzi's theology is the One, the absolutely simple first principle of all. It is both "self-caused" and the cause of being for everything in the universe. The cosmos is subdivided in grades and orders which reflects the harmonic structures of the nature, which is readable according to musical and geometrical symmetries. The soul is a fundamental mean of communication of the universe. Through the harmonization of Scriptural quotes, Platonic doctrines, Hermetic texts, and Kabbalistic interpretations, Zorzi analyzes the birth and the movements of the soul. He supposed a double moment in the creation in order to conciliate the creation of the man as image of God (*Gn.* 1. 26–27) and the successive formation of the man from the ground through the breath of life (*Gn.* 2. 7). So, according to Zorzi, God has created a universal soul, from which derived the individual souls, as from a mass of molten glass derived the jugs. The insufflations of the soul on Adam correspond to the second act of the creation. In other words, the universal soul should be considered as the Platonic idea: an archetype of the soul, to which the individual souls take part. The solution would allow to reconcile the creation *ab aeterno* with the continuous "infusion" of the souls, which would have forgotten their participation to the archetype, when they become individuated soul (*In Scripturam Sacram Problemata* p. 203 prop. 492–493). The soul is tied with the supernatural world and has a deep similarity with the angelic intelligence, sharing almost the same features of the angels. For this reason, angels serve as prophetic guides as well as their help in spiritual transformation.

In this harmonic architecture, the man has a fundamental role as the midpoint of the universe. Zorzi used arguments derived from Giovanni Pico della Mirandola, to show that the man participates both to the terrestrial and the superior things. With the help of Kabbalistic exegesis, Zorzi connects the different parts and functions of the body to the ten

sefirot: this operation allows the connection between immanent elements and transcendent ones.

Fundamental axis of Zorzi's theology (particularly in the *De Harmonia Mundi*) is chrystology: Christ, of both human and divine nature, has the perfect role of medium, as synthesis and center of everything, enclosing in himself, as *logos*, the "ideal" reason of the whole cosmos. The result of his speculations is a fine drawing of prophetic and astrological lines of the second *canto* of *De Harmonia Mundi* that seeks to demonstrate the eternal presence of Christ in the world by means of an extensive use of the patristic and Kabbalistic sources.

The cosmic role of Jesus as well as the profound analogy that ties the history of mankind to the ontological structures of the universe makes Christ's sacrifice decisive not only for human redemption from the original sin but also for the entire nature. The Venetian monk probably believed near the moment of the cosmic regeneration, with the absorption of the fractures between religions and the conciliation of mundane and spiritual elements: when the time will be ripe, in the seventh day of rest of the *Genesis*, all the creatures would be then returned to the Creator.

Significance and Legacy

Zorzi was fundamental in creating a sort of philosophical encyclopedia on Platonism, Pythagoreanism, and Kabbalism, destined to be influential. Giulio Camillo Delminio, Marcello Palingenio Stellato, Leone Ebreo, Cornelius Agrippa, Guillaume Postel, and John Dee were all careful readers of Zorzi (Blau 1944; Secret 1964). His books were quite successful indeed: *De Harmonia Mundi*, in particular, was published in Paris in 1546 and 1564 and then translated in France by Lefèvre de la Boderie (1578). Its influence might also be measured by the fact that the most authoritative book on magic in the sixteenth century, the *De Occulta Philosophia* of Cornelius Agrippa, was reviewed by the author after an attentive scanning of the *De Harmonia Mundi* (Perrone Compagni 1982, 1992, p. 35 sgg.)

The books of Zorzi will actually have a long censorial ride, started before of the creation of the Sacred Congregation of the Index. Initially, the printing of *De Harmonia Mundi* in 1525, despite some doubts, does not worry too much the orthodox hierarchies (Vasoli 1974, p. 177 e p. 227). After all, the book appeared as an expanded *summa* of the doctrines of Ficino and Pico, and the hazardous issues were hidden in a massive tome of uneasy reading. But when the arguments of *De Harmonia Mundi* were proposed in the *In Sacram Scripturam Problemata* in 1536, disembodied in single propositions tied to Scriptural quotations, they appeared more dangerous. The Ficinian atmosphere was far, and the central problems for the theologians were the last efforts to solve the Protestant schism in direction to an internal reform of the Catholic Church that cannot be postponed. The *Problemata* was the answer of Zorzi to the crisis of the Church, but the book bothered the Vatican as well several protagonists of the Italian evangelical movement, as Gasparo Contarini, Federigo Fregoso, Gregorio Cortese, his possible allies. The book finished, in fact, under the observation of Tommaso Badia, the Master of Sacred Palace, appointed to examine the dangerous texts. Gasparo Contarini, friend of Zorzi's family, tactfully express his criticism on the doctrine of the soul and of the Trinity, maybe to avoid a tougher attack of other theologians (Contarini 1537). Contarini fought the Jewish and Platonic matrix of the double creation of the soul and the suspected Arianism of Zorzi's Trinitarian dissertation. More generally, he found very suspicious the continue recourse to the Kabbalistic hermeneutic and the use of Origen of Alexandria.

The Platonic errors founded by Contarini were resumed and deepened by Sixtus of Siena, in the fifth book of his *Bibliotheca Sancta* (Sixtus of Siena 1566, II, p. 574 sgg.). Interestingly, Zorzi is the only modern theologian extensively quoted (and indicted) among the wrong "expositors" of the Old Testament. The work of Sixtus was the guideline for the official censors charged to expurgate the works of Zorzi. The hazards of the *Problemata* have been signaled in fact in the 1577 – in the long process of the review of the Roman *Index*

of 1564 that will run until 1589 – probably in parallel to the success that the tomes have found in France in those years. Both the books of Zorzi were then suspended in the *Index* of Parma of 1580 and in the official Roman *Index* of the 1596, with the clause "until they were espurgated" (*donec corrigantur*). The operation of an orthodox editing of Zorzi was complicated, for the vastity and the obscureness of his pages, as an internal document of the Congregation denounced in 1583 (Rotondò 1973, p.1436; p. 1456; Ricci 2008; Vasoli 1991), but also for the difficulties to divide the philosophical parts and the theological proposals and to reduce his heresies to already known categories. Since the first interventions, the hostilities of the censors were directed against its mixture of Platonic and Kabbalistic doctrines. The development of process was finally concluded at the beginning of the seventeenth century, with the *expurgationes* finally published by Giovanni Maria Guanzelli in his *Index librorum expurgandorum* (1607): Zorzi obtained the doubtful primacy to be the recipient of the largest number of corrections in the history of the *Index*.

Abstract

János Zsámboky (Samboky), by his humanist name Johannes Sambucus (Trnava, 1 June 1531–Vienna, 13 June 1584), a Hungarian-born scholar, philologist, historian, physician, cartographer, letter-writer, and collector of manuscripts, books, and art treasures. He spent 22 years in various towns of Europe. From 1564 until his death, he lived in Vienna, in imperial court service.

[Sambucus](#)

Heritage and Rupture with the Tradition

Sambucus studied at Wittenberg University, but following either the Lutheran or other denominations is not characteristic of him. Of literary tradition, he was mostly interested in antique culture and contemporary humanist literature. He did not break with medieval religious heritage spectacularly, but he preferred philological aspects to anything else. His correspondence contains 340 letters, which show his orientation. He took

part in the intellectual movement of European “*respublica litteraria*”; he was in contact with almost every renowned scholar of his age via correspondence or in person. First these were academic contacts (Vienna, Georg Rithaymer; Ingolstadt, Veit Amerbach and Peter Apian; Strassburg, Johannes Sturm; Paris, Jean Dorat, Adrien Turnèbe, Petrus Ramus, and Pascal Duhamel, contact with the Pleiade; Padova, Andreas Vesalius). He was a passionate collector of books and manuscripts. His library contained 3,327 volumes, mainly Greek and Latin works on rhetoric, philology, and theory of language. He published several pieces of his highly valued collection of Latin and mostly Greek manuscripts (c. 600 volumes) partly himself, partly through other publishers. Thus he came into contact with outstanding philologists, philosophers, and publishers of his age (Paulus Manutius, Christophe Plantin, Piero Vettori, Theodor Zwinger, Fulvio Orsini, Antonius Muretus, Johannes Oporinus, Conrad Gesner, Abraham Ortelius, Joachim Camerarius Jr., Carolus Clusius, Justus Lipsius, Johannes Crato von Krafftheim, Hugo Blotius, Nicasiaus Ellebodium, and others). As part of his conscious editing program, he published more than 50 works in print, among them important works of humanist writers connected to Hungary (Petrus Ransanus, Antonio Bonfini, Janus Pannonius, István Werbőczy). Twenty-eight unfinished publishing projects of his are known from the time before his death.

Innovative and Original Aspects

In the case of Sambucus, it may not be regarded only as a formula of modesty when he said that his intellect was just enough for diligent work, so he considered the transmission of antique, mainly Greek works and their publication more important than writing original works. As a philologist, he did not favor conjectures worked out from personal ideas, but he tried to find the most authentic manuscripts and make editions based on them. With his editions, he made efforts mostly for the revival of Greek literature and culture, which he, like Dorat, considered more valuable than Latin.

He summarized his views in his works titled *De imitatione Cireroniana* (Paris, 1561). Sambucus wrote only in Greek and Latin, but he held it important to “defend” Hungarian language, and he thought to improve it on the model of the Latin language. He wrote about the art of letter-writing, and he combined Neoplatonic and Aristotelian approach when talking about Horace’s *Ars poetica*.

Impact and Legacy

The most renowned of his own works is *Emblemata*, an illustrated volume of Latin poems, which was edited five times. Geoffrey Whitney translated 50 emblems from it into English, which were used by William Shakespeare as source material. Sambucus had a significant impact especially on the science of philology. By publishing the works of Diogenes Laertios, Petronius, Plautus, Vegetius, and others, he created the basis for editing primary sources in later times. In the last two decades of his life, he lived a courtly life in the imperial court in Vienna, but scholarly activity was the most important for him all the time. However, it caused a financial disadvantage for him, so he sold a great part of his valuable collections to Emperor Rudolf II.

Biography

Ludovico Zuccolo was born on September 18, 1568, at Faenza, an Italian town in the province of Ravenna, then part of the Papal States. Little is known about his life. He was the son of Alessandro, a Faentine nobleman who died in jail after being sentenced for heresy a 5-year service on a papal galley (Nediani 1953–1954; Firpo 1969; Frajese 1995; Lavenia 2020). In 1607–1608, Zuccolo joined the Accademia degli Smarriti, and while a student at the University of Bologna, he gave lectures in philosophy and eventually graduated there on 13 July 1608 (Pissavino 1984; Lavenia 2020). Shortly afterwards, he entered the service of Francesco Maria II della Rovere, last Duke of Urbino, as secretary and tutor to his son Federico Ubaldo, and issued his first book, the *Gradenico*. However, the ill-will of several men of letters at court as well as his impatience with the rigid rules of courtly life eventually led him to look for appointments and patrons elsewhere. During his stay at Urbino, Zuccolo also travelled between Venice, where he published some of his dialogical works, and Faenza, where he became a member of the *Accademia dei Filoponi*, the town's most illustrious and enduring literary academy; founded in 1612, continued into the early nineteenth century. After 9 years “of ill-fated servitude,” as he himself defined his stay at the ducal court (Zuccolo 1625a, b), he definitely left Urbino sometime around March 1617 and moved firstly to the Republic of Ragusa, in Dalmatia, where he taught philosophy (Nediani 1960, 1969), and finally established himself in Faenza at the beginning of 1618. To this period date back

Abstract

Ludovico (Lodovico) Zuccolo (1568–1630), also known as the *Picentino* because he lived for almost 9 years (from 1608 to 1617) in the

both his acquaintances with the political-cultural circles close to Fra Paolo Sarpi and his involvement with the Venetian printer Marco Ginammi, who was constantly in danger of censorship because of the printing of books not in line with the Counter-Reformation. Much of Zuccolo's literary production came out from his press. After trying unsuccessfully to obtain a university chair, first at Bologna and later at Padua (Nediani 1960; Pissavino 1984), in December 1623 Zuccolo found himself in Spain with the Papal nuncio, Innocenzo Massimo (1581-1633), bishop of Bertinoro, and later bishop of Catania. Once back to Italy in Rome at the end of 1625, Zuccolo was reported twice (November 29th and December 18th) by a young Portuguese called João Monteiro to the Holy Office on suspicion of heterodoxy. He had denied, it was alleged, the immortality of the soul by favorably quoting the views of Epicurus, Galen, and Aristotle, besides having suggested that "religion was a pretext for the princes for keeping the people in check" (Ginzburg 1967; Nediani 1968; Frajese 1995). His family's long-standing religious stance also made him a target of the Venetian Inquisition, which viewed his works with grave distrust. In the event, it was the Venetian ecclesiastical censors who prohibited the publication of an essay due to be included in the first collection of his *Discorsi* (1617), chiefly on account of its critical assessment of Thomas More's *Utopia* and its catholic author. The dialogue, called *L'Aromatario, ovvero della repubblica d'Utopia*, a book resonant with Machiavellian echoes, was eventually published in 1625 in the second edition of his *Dialogues* (Nediani 1960; Firpo 1969). Over the next 2 years, he moved from one city to another; first he went to Naples and later to Sicily, perhaps in the hope of finding a safe haven following the proceedings instituted against him by the Congregation of the Holy Office. In the last months of 1627, he was employed in the service of the legate cardinal Bernardino Spada da Brisighella in Bologna, where he probably died in 1630 from the plague (Nediani 1960).

Well-versed in ancient Greek and Roman culture, with a preference for Aristotelian philosophy, and devoid, it seems, of any interest in Christian authors, Zuccolo developed a political

philosophy and utopianism that was remarkably original and unconventional. Neglected for many centuries by scholars, his merits as a political theorist were revived, early in the twentieth century by the German historian Friedrich Meinecke and the Italian idealist philosopher Benedetto Croce. The latter presented him as "the most profound political philosopher of his time and a forerunner of the theories of the autonomy of politics from morality" and declared his *Della ragion di Stato* to be "the most sharp and original work written on the subject in his time" (Croce 1927). In more recent years, Zuccolo has been portrayed by critics as a utopian thinker (Pissavino 1993, 2000, 2007a), a heretic and libertine (Ginzburg 1967; Firpo 1969).

The earliest of Zuccolo's manifold works is the unpublished *De quantitate solis contra vulgatas astrologorum et philosophorum disceptatio*, written as early as 1606. The treatise is an apology for Epicurus's astronomic theories, prompted perhaps by his bid for a post at the court of Duke Francesco Maria II, who had shown great interest in the sciences and the arts (Nediani 1957; Pissavino 1984). In the first of his printed dialogues, *The Gradenigo. Dialogo nel quale si discorre contra l'amor platonico, et a longo si ragiona di quello del Petrarca* (1608), Zuccolo severely condemned Platonic love, or the courtly love tradition of Petrarch and his followers, particularly Judah Leon's *Dialoghi d'amore*. His next dialogue called *L'Alessandro*, published in 1613 together with three eclogues, the *Eduilio*, the *Critio*, and *Dorinda*, is a defense of pastoral drama based on the idea that its "youth" compared favorably to the "decrepitude" of comedy and tragedy. Accordingly, pastoral drama is the most popular of the three genres inasmuch as it satisfied contemporary taste for spectacles befitting princely decorum (Zuccolo 1613). Both *Gradenigo* and *L'Alessandro* were reprinted in his first edition of *Dialoghi* published in Perugia in 1615. In the same year, Zuccolo dedicated the *Heroica virtus sive de honesto gloriae studio* to his disciple, Federico Ubaldo della Rovere, who succeeded to the Duchy of Urbino on 3 November 1621. The treatise, didactic in tone, encouraged the young prince to aspire to virtue and glory and underlined the philosopher's civic role (Pissavino

1984). The topics of virtue and glory reappear both in his 1617 *Discorsi. Della gloria. Del genio. Della pena della discortesia* and in *Discorsi dell'honore, della gloria, della riputatione, del buon concetto* (1623), in which Zuccolo opposed Botero's idea that the best way for a ruler to maintain stability in the state and concomitantly keep hold of power was to gain a good reputation among his subjects. Rather the indispensable conditions for peaceful coexistence and good government were, he insisted, honor and virtue. Religion might be the most effective means, but honor of a ruler or ruling body was a viable alternative for encouraging social cohesion. Finally, in the *Discorso delle ragioni del numero del verso italiano* (1623), a short work on poetics addressed to Innocenzo Massimi, he examined the forms, criteria, and examples of Italian versification and mourned the progressive decadence of Italian poetry (Zuccolo 1623b; 2005).

Zuccolo's most important innovations were in the field of political theory and more specifically his interpretation of "reason of state" and the methods for building a consensus in an ideal state. In 1621, he published the *Considerationi politiche e morali sopra cento oracoli d'illustri personaggi antichi* - a commentary of a hundred "oracles," or quotations from classical Latin authors, with his translations into Italian - in which he discussed, "following the teachings of Aristotle, the authority of Cornelius Tacitus, and other political writers, various matters related to the government of the States, to the spreading of good customs, and to the understanding of History" (Zuccolo 1621). The work, dedicated to the archbishop of Ravenna, Cardinal Luigi Capponi, encompasses the short tract *Della ragion di Stato* (*Oracle*, XI) written in contrast with Giovanni Botero and Scipione Ammirato's arguments on the subject (Lavenia 2020). It became popular in Italy and abroad, partly thanks to the Latin translation by the German jurist Johann Garmers (*Dissertatio de ratione status*, 1663). A revised and corrected edition of the *Considerationi* (1623), dedicated to the Genoese poet and writer Giovanni Vincenzo Imperiale, contains a reply

to an unknown "Accademico Pellegrino" in Rome who had criticized the first edition of his tract.

Political theory became a popular topic in Counter-Reformation Europe, particularly in Italy, during the sixteenth and seventeenth centuries. Zuccolo's *Della ragion di stato* was an innovative example in several respects. According to him, "reason of state" was no more than the understanding and application of the means for establishing and maintaining any given state. That is to say, there was not one "reason of state," but many, as many, in fact, as there were existing forms of state. The *ratio status* of a good monarch differed from that of a tyrant and differed too from that practised in a republic (Zuccolo 1621). Taking issue with Machiavelli that the end justified the means, Zuccolo relates the question of political authority and right political conduct to the different forms and practices of governments. "Reason of state" did not necessarily entail breaches of the law. It tended to occur in corrupt states. By contrast in healthy states, civil law and "reason of state" could coexist. In general, as Meinecke pointed out, "the *raison d'état* of good State forms was itself respectable and good; and the opinion that all *raison d'état* was evil applied only to bad forms of the state" (Meinecke 1924). The novelty of Zuccolo's interpretation was that "reason of state" did not have an intrinsic moral or amoral status. It had been Machiavelli and others in his train, "wicked and sinful writers," who taught "the ways and means to act in accordance with reason of State in evil governments" (Zuccolo 1621). True, good governments are rare, as Aristotle had declared, but this did not prove that good versions of "reason of state" were impossibilities. In keeping with this interpretation, Zuccolo concluded that republican government was preferable to any other since, more than any other type of state, it encouraged the coincidence of "reason of state" and good government.

Zuccolo's classification between "good" and "bad" forms of state introduced the Aristotelian principle that politics should provide for the public welfare of those who obey and those who

command. “Reason of state,” following his definition, served to defend the state and not (as Machiavelli had said) the interest of the ruler. It constituted, that is, only a part of the art of government, the other part being “political pragmatism” (*prudencia politica*) founded on popular approval. Hence, in response to Botero and to the leading Italian political theorists of his time, he contrasted the “reason of interest” with a reason “that is proper to the state alone,” the latter being confined “those interests which affect the constitution and form of the republic” (Zuccolo 1621).

In 1625, a second edition of Zuccolo’s *Dialoghi*, containing old and new texts revised and enlarged by the author, was published in Venice. The work includes the so-called utopian writings, the already mentioned *L’Aromatario, overo Della Repubblica di Utopia*, in which he laid bare the inaccuracies and contradictions in More’s *Utopia*; *Il Porto, overo Della Repubblica d’Evandria*, in which he sketched of an utopian community intended as a possible model for existing societies, and *Il Belluzzi, overo Della città felice*, in which he extolled the political liberty of the small Italian republic of San Marino. The collection also involves a critical analysis of Aristotelian doctrines and a *summa* of the practical wisdom that he had accrued during his many years of service at Italian Renaissance courts. Even so, it was the aristocratic republic that he identified as the best form of government (*optimus status*), with freedom praised as the indispensable condition for its property. Granted that there were different types of “reason of state” according to the type of state, and granted too that maintaining power was the more likely the more that a ruler, irrespective of the kind of state, governed well (*bene operare*), conversely it was also true that the ideal state could be adapted to the needs of statecraft as it was actually practised, as in fact utopian models also required (Pissavino 2007b).

Like his writings dealing with the “reason of state,” Zuccolo’s utopian dialogues proposed a secular response to the political issues posed by Counter-Reformation ideology. The relentless focus on political preservation as it emerges in

this literary production, turned in later works into a peremptory admonition to harmony (Pissavino 2014). In *Molino, overo della amicitia scambievole fra’ cittadini*, a dialogue also belonging to the 1625 Venetian collection, he argued that political stability was guaranteed by friendship and harmony among the citizenry. The same topic appears in the *Secolo dell’Oro rinascente nell’amicizia fra Nicolò Barbarigo e Marco Trivisano* (1629), a work in praise of the friendship between two influential Venetian patricians, Nicolò Barbarigo and Marco Trevisano. The book did not endear the author among the literati of contemporary Venice, who had written, in an unflattering vein, of the relationship between the two men. Furthermore, in *Nobiltà commune et heroica* (1625), dedicated to Pietro Contarini, Zuccolo attacked Alessandro Tassoni’s views on nobility, provoking a literary dispute in which outstanding academicians of the time, such as Camillo Baldi and Scipione Chiaramonti, became involved.

Zuccolo’s last printed work is the *Discorso dello amore verso la Patria*, posthumously published in 1631. The book contains a covert criticism of temporal power in the form of a diatribe against Charles V, particularly his failure to curb the spread of Lutheranism in Germany and his focus, instead, on the conquest of Italian states (Firpo 1969). Deploping the decline of the mores and national pride, even more evident when compared with the state of affairs in other European lands, Zuccolo expressed his disdain for the wretched circumstances of the small Italian States and city-states that had been occupied by foreign armies. More provocatively still, he identified the Roman Church and the Catholic religion itself as the reason why Italians had not recognized themselves as a free people, a view strongly reminiscent of Machiavelli.

Centre for Renaissance Texts, Department of Philosophy, Faculty of Arts, Palacky University, Olomouc, Olomouc, Czech Republic

Abstract

Humanist, physician, philosopher, and polymath, Theodor Zwinger first studied under the anti-Aristotelian Petrus Ramus in Paris and later in the bastion of Aristotelianism in Padua. He became one of the most influential late humanists of Basel. He published commentaries on Galen and Hippocrates and commentaries on Aristotle's *Nichomachean Ethics* and *Politics*. He is also the author of books on ethics, history, and travel. Despite his earlier dissent with Paracelsianism, he later accepted certain Paracelsian concepts. His book entitled *Theatrum humanae vitae*, comprising thousands of pages of "encyclopedical" contemporary knowledge, was extremely influential up until the beginning of the eighteenth century.

Biography

Theodor Zwinger was born into a renowned Basel humanist family as the nephew of the famous Basel printer Oporinus. Theodor received a private humanist education in his native city through his stepfather, the humanist Conrad Lycosthenes. He continued in his studies in Lyon over the years 1548–1651 where he simultaneously worked in a printing shop. He moved to Paris in 1551 where he studied under Petrus Ramus. Zwinger studied medicine in Padua under Bassiano Landi as of 1553 where he obtained his doctorate in 1559. After his return from Italy, Theodor Zwinger opened up a private medical practice in Basel. In this period Zwinger edited in Basel the works of the Italian Platonist Francesco Cattani da Diacceto (Zwinger 1563) and also published commentaries on Galen (Zwinger 1561). Here and in his later works, Zwinger frequently employed the method of division of a subject by means of tables, which he derived either from his Paduan medical studies (Fortuna 1993) or from Petrus Ramus (Gilly 1977, 1979).

Zwinger became professor of Greek at the University of Basel in 1565, professor of ethics in 1571, and professor of theoretical medicine as of 1580. In the realm of practical philosophy, Zwinger commented on Aristotle's *Nicomachean Ethics* (Zwinger 1566) and *Politics* (Zwinger 1582) and wrote works dealing with ethics (Zwinger 1575), which followed in the Aristotelian tradition. Zwinger combined both the use of tables as a method of presenting ethics and enumerating examples of vice and virtues with the aim of connecting up ethical philosophical theory and the practice of living (Lines 2007).

Zwinger, as a pupil of Paduan medicine, initially dissented from Paracelsus and Paracelsianism. After his edition of Hippocrates (Zwinger 1579), however, Zwinger began to appreciate certain parts of Paracelsian medicine due to its emphasis on experience which was in his view similar to Hippocrates (Gilly 1977, 1979). Zwinger was intrigued by Paracelsus' work, specifically by his efforts in healing by means of powers hidden in nature (Zwinger 1610). He criticized, in contrast, Paracelsus' lack

of interest in anatomy (Portmann 1987). Theodor Zwinger was later in contact with the Paracelsian physician Petrus Severinus (Shackelford 2004) and may have been a teacher of Heinrich Khunrath and Andreas Libavius (Forshaw 2008).

The most renowned work by Theodor Zwinger was the comprehensive compilation of contemporary knowledge entitled *Theatrum humanae vitae*, first published in 1565 (Zedelmaier 2008). This systematically ordered knowledge, presented with the help of tables, had a double goal: theoretical knowledge and a practical attitude to the world, i.e., an ethical approach. Zwinger distinguishes between two equal sources of knowledge: theory on the one hand and experience and history on the other, which deals with particulars and provides exempla (Blair 2005). The first edition of the *Theatrum* contained 1,400 pages (Zwinger 1565) and the third edition from 1586 as many as 4,500 (Zwinger 1586). The *Theatrum* was reworked in 1631 by the Catholic Laurentius Beyerlinck into eight volumes of 7,500 pages plus an index and was printed in this form five times up until 1707.

Abstract

John Zygomalas and his son Theodosius were sixteenth-century Greek scholars. They resided in Constantinople and were active in the contacts between Protestants and Greek Orthodox Church. Their contribution to the preservation and further development of ancient Greek and Byzantine thought was crucial, since they held key positions in the Greek Orthodox Patriarchate.

Biography

John Zygomalas was born in Nafplio, a small city in Southern Greece, which at the time was occupied by the Venetians. Stavrakios Malaxos and Arsenios Apostolis took care of his elementary education and taught him ancient Greek. He continued his studies at the University of Padua, where he learned Latin and Italian. He rejected, despite offers, to stay in Italy and work for the Greek community in Venice. After spending several years in Italy he returned to Nafplio and worked as ecclesiastical orator and teacher. John was esteemed by the authorities of the Greek Patriarchate and accompanied the future Patriarch Metrophanes III in his trip to Italy. Around 1550 he moved to Adrianople and 5 years (1555) later to Constantinople, upon an invitation from the Patriarch Ioasaph II, who was Zygomalas' former

Zwinger, Theodor

► **Zwinger, Theodor**

student, in order to assist the educational plans of the Patriarch. There Zygomalas was proclaimed “Great Orator” of the Patriarchate. Until his death he lived and taught in Constantinople, possibly at the Patriarchal Academy. In 1576 Patriarch Ieremias II proclaimed him “Great Interpreter of the Scriptures.” The same year John traveled to Vienna in order to convert the emperor Maximilian II to the Orthodox dogma. John’s son, Theodosius, was also born in Nafplio and moved to Constantinople with the rest of his family. He quickly ascended the hierarchy and became chief secretary of the Patriarchate (*protonotarios*). He played a significant role in the correspondence between German Lutherans and the Patriarchate. His personal correspondence with Martin Crusius, the famous professor of ancient Greek and Latin philology at the University of Tübingen, is important since he encouraged German intellectuals to study and appreciate post-Byzantine culture.

Innovative and Original Aspects

Since his arrival in Constantinople John Zygomalas started to teach Ethics, Dialectic, and Rhetoric. Patriarch Ioasaph II referred to Zygomalas when he wrote that “we engaged a master of philosophy.” According to Crusius, Zygomalas’ teaching was of poor quality and his philosophical and philological background mediocre, although he had studied at Padua. Despite Crusius’ bitter comments, John Zygomalas was very influential. The vast majority of the ecclesiastical authorities and scholars in various fields were his students. Theodosius Zygomalas was a productive translator. He rendered in Modern Greek several works of ancient and Byzantine literature.

Impact and Legacy

John Zygomalas was a leading figure in the Patriarchal Academy, the only notable

educational institute in the Greek-speaking territories during the sixteenth century. The vast majority of the ecclesiastical authorities and scholars in various fields were his students. Theodosius’ work gave to Western Europeans, through his correspondence with Crusius, the opportunity to know and appreciate Modern Greek language. Their work and the letter exchange with German Protestants contributed in the dissemination of post-Byzantine Greek thought in Western Europe and inflamed philhellenism.
